Department of Biology  
Western Carolina University  
Cullowhee, North Carolina 28723

## Introduction

Coweeta Hydrologic Laboratory, an outdoor research facility, is situated on the eastern flanks of the Nantahala Mountains of the Southern Blue Ridge Province between the Blue Ridge escarpment 30 km (18.5 mi) to the southeast and the western Blue Ridge escarpment 75 km (36 mi) to the northwest. Its intercepted waters descend from the Nantahala crest that peaks at 1,575 m (5,200 ft) elevation to the valley floor of Coweeta Creek at 670 m (2,200 ft) over a distance of only 4.4 km (2.7 mi), and continue eastward into the Little Tennessee River Valley.

The Laboratory is comprised of three major tributaries. Shope Fork and Ball Creek come together to form what is called the Coweeta Creek Basin. The Basin totals 1,626 ha (4,016 acres) and is compartmentalized into over 40 watershed units that have been experimentally treated (or left intact in the case of control watersheds) since establishment of hydrological research here the early 1930's. A third basin, drained by Dryman Fork Creek, is situated to the south of the other two basins, and is separated by a major dividing ridge. Dryman Fork Basin contains about 558 ha (1,379 acres) and has not been treated since its acquisition in the 1920's (Dils 1957; Hewlett and Douglass 1968).

Since 1968 Coweeta has served as a site for a variety of ecological studies and is currently designated a site for Long Term Ecological Research (LTER), a program of the National Science Foundation. This collection project is a part of that effort. Coweeta was also designated a Biosphere Reserve under the Man and Biosphere Program of the United Nations in 1976 (UNESCO 1981). It is paired with the Great Smoky Mountains National Park as the main treatment unit for ecosystem studies. While Coweeta has a long history and a series of publications dealing with various watershed function and management studies (Douglass 1972; Crossley and Swank 1983), it did not have a comprehensive list and documented vascular flora until this project. The Great Smoky Mountains, on the other hand, had flora lists with herbarium documentation of the flora dating from the late 1920's and early 1930's, with documentation in herbaria at the University of Tennessee (and to a lesser extent other herbaria) and the Park Headquarters (White 1982). The core of the flora listing was first completed by Jennison in 1937 and published in 1939. Peter White reviewed and documented 1,492 taxa, including 288 he judged to be exotics, in his annotated checklist (White 1982). Coweeta's flora listing is practically nonexistent except for partial lists in publications or theses (e.g., Williams 1954). No documentation in the form of herbarium specimens is known for the cited plant materials. As ecosystem studies become more detailed with reference to vascular plants, documentation becomes much more important.

## Methods

Since ecosystem studies often deal with various life stages of plants, collection of as many representatives of life stages of the Coweeta flora as possible was a major objective. To accomplish this, a pattern of search was established to cover as much of the varied habitats of the basin as practical. Roads, paths, disturbed areas, mature forests, woodland seeps, rock outcrops, cliffs, etc., were included in a collecting plan for a 2-day period to achieve this aim. Collections were made at about 2-week intervals over the growing season for the 2-year collecting period. Specimens were normally collected in duplicate (some in triplicate); rare, threatened, or endangered species were collected only if there were three or more specimens present at the collection site. In some cases, only pieces of a species were collected. The best clue for the identification of early life stage of a given species was observation of the

life-stage sequences in the field population. Venation patterns, pubescence, and other physical characteristics also helped with identifications. Field notebooks organized by families with charts of life stages were found to be very helpful in record keeping. The Ceweeta topographic map (scale 1:144,000) with grid lines was used to coordinate the collection locations, and these coordinates were indicated on each label. The entire label data set was filed on four flexible computer disks using a pfs-FILE (personalized filing system for Apple II by Software Publ. Corp.) program, which should prove useful for future data manipulation. To our knowledge, this was the first time an attempt was designed to cover an area as large as Ceweeta with collections of all available life stages.

### Results and Discussion

The collection consists of 604 taxa represented by 327 genera of 97 families. Seldom was it possible to collect all the life forms for a given species (32 of the 604 taxa have complete life-cycle sets). We did not expect to collect complete sets of most plants since germination of seeds or spores is of short duration and infrequent for many species. Additionally, some species flower and fruit infrequently and thus were not found during the study. The main collection is deposited in the herbarium at Ceweeta Laboratory. The duplicate collection is deposited at Western Carolina University Herbarium (WCUH) in Cullowhee.

Management of the collections is an important task. With about 2,400 specimens that were processed by about 12 student workers over a period of 2 years, careful management was required. In addition to the usual efforts of collecting and herbarium preparation, this project included attempts to fill life-stage gaps, accurate mapping of collection sites, collating multiple labels with several specimens that make up the sets, and composing several specimens on the herbarium sheet with a sense of proportion and attention to detail. This resulted in an effort of at least three times and perhaps six or seven times that involved with single-stage collections.

Because of the care and attention given to the above efforts, the plant life sets will be very valuable for ecosystem biologists. Some general knowledge of plant identification may be required, such as recognition of general groupings, like plums, apples, oaks, etc., but once this is achieved, the local herbarium is small enough that these specimens could be quickly compared. For those interested in species biology, specimens with various life stages may save considerable time in searching for them in the field since the season and types of habitat will be given by the labels.

Hopefully, this paper will be an encouragement to collectors to look for additional life stages during routine collecting. Often it is possible with a few extra small sampling bags to collect the seedlings or early juveniles of a given species at the same time that flowers or fruits are collected. We have observed that some species have all stages present at a given time, e.g., annuals such as speedwell (*Veronica arvensis*) or perennials such as grass of parnassus (*Parnassia asarifolia*). Closer observation will enable the collector to recognize the variation that a species may display at the different life stages.

#### Acknowledgments

We express our gratitude to Dr. Wayne Swank for his encouragement and suggestion that we assist in this LTER project. Project leader, Dr. D. A. Crossley, Jr., has been most helpful in acquiring project funding and advice. The several colleagues who have helped by advising in collection routes we also appreciate. Dr. Lindsay Boring has helped in adding about 100 specimens to the collection and is responsible for several listed species. We also appreciate the helpful manuscript comments of Drs. J. H. Horton and Wayne Swank.

This project was funded as a subcontract to Western Carolina University by the University of Georgia (subcontract No. RR271-124) from the NSF-LTER grant (DEB-8012093).

## The Collection

The following charts are organized into four major groups. On the assumption that most users would be familiar with the differences between ferns and fern allies, gymnosperms, monocots, and dicots, these four groups were organized by families, genera, and species alphabetically. Scientific names are followed by common names. Scientific and most common names are the same as those used by Radford, Ahles, and Bell (1968) or Bailey (1949) for cultivated species, with some common names after Fernald (1950) or from local usage.

Definition of symbols used below are:

S = seedlings (specimens with cotyledons or seed coverings attached).

J = juvenile (a stage in which cotyledons have fallen off the plant [annuals] or the specimen is 2 to several years old [perennials including ferns]).

F1 = flowers (or cones of gymnosperms) (reproductive stage at anthesis).

Fr = fruit (mature sporangia of ferns and fern allies, cones of gymnosperms, or matured ovularies of angiosperms).

Rs = rosettes (plants with more than two leaves disposed around the crown or stem at ground level).

Other = additional specimens, or if in parentheses, an indication of the character state of the specified stage.

\*\* = specimen of the given type deposited at Ceweeta and WCUH herbaria.

\* = specimen at Ceweeta herbarium only.

Pittillo, J. Dan; Lee, Martha  
Reference plant collection of the Coweeta Hydrologic  
Laboratory, North Carolina. Gen. Tech. Rep. SE-29.  
Asheville, NC: U.S. Department of Agriculture, Forest  
Service, Southeastern Forest Experiment Station; 1984.  
34 pp.

Describes the results of a botanical survey of the 4,000-acre Coweeta Creek Basin, a Long Term Ecological Research area.

**KEYWORDS:** Botanical survey, herbarium, flora, Long Term Ecological Research.

**The Forest Service, U.S. Department of Agriculture, is dedicated to the principle of multiple use management of the Nation's forest resources for sustained yields of wood, water, forage, wildlife, and recreation. Through forestry research, cooperation with the States and private forest owners, and management of the National Forests and National Grasslands, it strives—as directed by Congress—to provide increasingly greater service to a growing Nation.**

**USDA policy does not permit discrimination because of race, color, national origin, sex or religion. Any person who believes he or she has been discriminated against in any USDA-related activity should write immediately to the Secretary of Agriculture, Washington, D.C. 20250.**
