## SOUTHEASTERN FOREST EXPERIMENT STATION

### Asheville, North Carolina

Number 14

July 1952

#### CALCIUM CONTENT OF HARDWOOD LITTER FOUR TIMES THAT FROM PINE; NITROGEN DOUBLE

Most Piedmont forests, growing on land worn out by row cropping and abandoned, are low in site quality. They contribute appreciable flood runoff and sediment. Soil structure is poor and nutrient content low. Such improvement as takes place comes generally from litter fall, particularly **hardwood** leaves.

Studies at the Calhoun Experimental Forest, near Union, S. C., reported in Proceedings of the Soil Science Society of America, January 1952, show that shortleaf and loblolly pine contribute less nitrogen, calcium, and magnesium than **any** of the other common species. Where it is necessary to increase these elements in the surface soil under pure pine stands, the improvement can be accomplished by favoring a hardwood understory, as the following comparison indicates.

#### Nitrogen, calcium, and magnesium content of various Piedmont tree species growing in Union County, South Carolina

(In percent of element on oven-dry basis)

| Species                  | Nitrogen    | Calcium     | Magnesium   |
|--------------------------|-------------|-------------|-------------|
| Eastern redbud           | <b>1.16</b> | <b>2.96</b> | 0.22        |
| Eastern red oak          | 1.00        | 1.42        | <b>0.36</b> |
| White oak                | <b>0.92</b> | <b>1.69</b> | <b>0.30</b> |
| Blackjack oak            | 0.85        | <b>0.96</b> | 0.28        |
| <b>Post</b> oak          | 0.80        | <b>0.97</b> | 0.22        |
| Black oak                | <b>0.70</b> | 1.04        | <b>0.23</b> |
| Southern red oak         | 0.60        | 1.06        | <b>0.23</b> |
| Flowering dogwood        | 0.68        | <b>3.38</b> | <b>0.53</b> |
| Hickory                  | <b>0.62</b> | 2.78        | <b>0.62</b> |
| Yellow-poplar            | <b>0.53</b> | <b>2.61</b> | <b>0.72</b> |
| Red maple                | 0.51        | <b>1.32</b> | <b>0.33</b> |
| American <b>sweetgum</b> | <b>0.49</b> | 1.30        | <b>0.47</b> |
| Shortleaf pine           | <b>0.45</b> | 0.59        | 0.19        |
| Loblolly pine            | 0.31        | 0.43        | 0.15        |

To find the per-acre quantity and quality of litter fall under various Piedmont forest types, measurements were made in nine stands in Union County, s. c., from September 1950 to September 1951. As shown in the following table, although the weight of litter per acre from pure shortleaf stands nearly equals that from hardwoods, the amount of nitrogen returned is **less** than half, and the amount of calcium less than one-fifth that from hardwood stands. Owners troubled by littleleaf disease in shortleaf stands may find that such differences in nutrient content are important.

Litter fall from forest stands in Union County, S. C.  
(In pounds per acre, oven-dry basis)

| Stand   | : Total litter, :<br>: <b>including</b> leaves, :<br>: <b>twigs, bark, and</b> :<br>: fruit : | : Leaf fall :<br>: | : Quantity of element<br>: returned in leaf fall |                      |
|---|---|--------------------|--|----------------------|
|   |   |                    | <u>1/</u><br>: Nitrogen                          | <u>2/</u><br>Calcium |

| Hardwoods<br>(average of 3 stands)            | 4502  | 3818               | 26   | 88                   |

1/ To get an estimate in pounds of equivalent applied sodium nitrate, multiply by 6.

2/ To get an estimate in pounds of equivalent applied limestone, multiply by 2-1/2.
