Primary wood-using plants and Forest Resource Units of East Texas, 1974.

East Texas Forest Industries, 1974

Daniel F. Bertelson

East Texas forests supplied more than 456 million cubic feet of roundwood to forest industries in 1974, an increase of 78 percent since 1964. Softwoods, mainly pine, made up over four-fifths of the total. Pulpwood and saw logs were the major products, accounting for 83 percent of the harvest. Veneer logs added over 15 percent, and poles made up more than half of the remainder (fig. 1). A total of 202 wood-using plants were in operation.

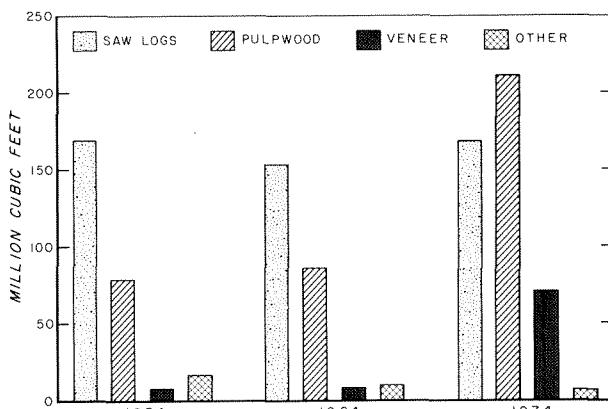

Figure 1.—Output of industrial roundwood, 1954-1974.

These are among the major findings of a canvass of all primary forest industries in East Texas. Previous surveys, conducted in 1954 and 1964, covered only Forest Resource Units 1 and 2. This canvass was extended to include Unit 3. Since the volume of wood harvested in Unit 3 was less than 1 percent of the total, all comparisons in this report will be made with volumes from the past surveys and will not be adjusted because of the extended area of study.

All primary wood-using plants in East Texas were visited by personnel of the Texas Forest Service, under the supervision of Edwin H. Barron, and by members of the Forest Resources Research Unit of the Southern Forest Experiment Station. This report tabulates total produc-

tion and shows softwood and hardwood output by county. It also lists the names and addresses of all primary forest industries; plant locations and resource units are mapped on page ii.

PULPWOOD

Round pulpwood harvested in East Texas more than doubled in the last decade; in 1974 the harvest was a record 2.6 million cords (fig. 2). Pulpwood has overtaken saw logs as the main product in East Texas and accounted for 46 percent of the area's total roundwood harvest.

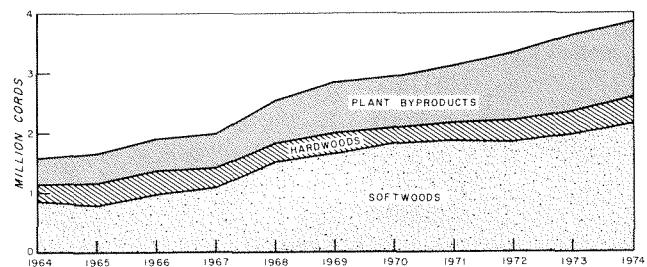

Figure 2.—Pulpwood production in East Texas, 1964-1974.

Softwoods (exclusively pine) comprised 83 percent of the total pulpwood harvest, an increase of 8 percent over 1964. Hardwood species composition has changed significantly in the last decade, although oaks still contribute about 32 percent of the total hardwood harvest. Gums have fallen from 57 percent to 19 percent of the total, and all other hardwoods have risen from 10 percent to 49 percent.

East Texas exported 661,000 cords of pulpwood to three adjacent States, and it imported some 232,000 cords from five States. Pulp mills in East Texas processed 2.2 million cords of roundwood, and 89 percent came from within the State.

Construction of four new plants as well as expansion of existing facilities has almost tripled East Texas' pulping capability from 2,595 tons per day in 1964 to 7,075 tons in 1974. Individual pulping capacity at the eight mills ranges from 50 to 1,450 tons daily. The sulfate process is used for two-thirds of the wood that is pulped in the area.

In addition to the roundwood volume, the equivalent of over 1.2 million cords of East Texas plant byproducts were used by pulpmills. This volume represents almost one-third of the area's total pulpwood production. Although the use of plant byproducts increased less than 1 percent last year, since 1964 it has almost tripled. The modest increase in 1974 reflects a leveling off of the availability of plant byproducts; more than 87 percent of the area's coarse residues were sold to the pulp industry. Further increases in the volume of plant byproducts available to pulpmills will depend upon increases in the production of plywood and lumber. The installation of chipping headrigs, which produce more chips and less sawdust, also will add to the available material.

SAW LOGS

East Texas produced over 1 billion board feet of saw logs in 1974, an increase of 11 percent since 1964 and a return to the level of 1954. Softwoods, mainly pine but including some cypress and redcedar, made up over 75 percent of the total volume. Two-thirds of the hardwood saw logs were oak, and the gums accounted for another 20 percent.

A total of 139 sawmills were in operation in East Texas in 1974. Sixty-eight were classed as large mills, in that individually they cut more than 3 million board feet annually, and 23 of these each produced over 10 million board feet in 1974. The large mills processed 91 percent of the lumber manufactured in East Texas; more than 77 percent of their output was softwood. Over 56 percent of the logs sawn at the 71 small sawmills were hardwood. Fourteen sawmills, which processed 40 percent of the area's lumber,

used chipping headrigs. Production of individual mills ranged from 2,100 to over 61 million board feet. The average output per mill in 1974 was 7.4 million board feet.

Almost half of the logs harvested crossed county lines before being sawn. This figure indicates the dominance of the large sawmills since small mills generally procure their raw materials in their home counties. Interstate movement was minor; less than 6 percent of the saw log harvest was to surrounding States, and only 34 million board feet were imported. Most of the movement between States was softwood.

All but five large sawmills reported selling wood chips to pulpmills in 1974, and 20 small mills disposed of their residues in the same manner. Over 58 million cubic feet of coarse residues were generated by the area's sawmills, and 90 percent of this volume was sold to the pulp industry.

VENEER

East Texas forests produced 460 million board feet of veneer logs in 1974, over 10 times the 1964 harvest (fig. 3). This great increase is the result of the expansion of the southern pine plywood industry. In 1974, East Texas had 20 veneer plants in operation. Nine produced pine plywood, nine manufactured container veneer, and two produced flat or face veneer.

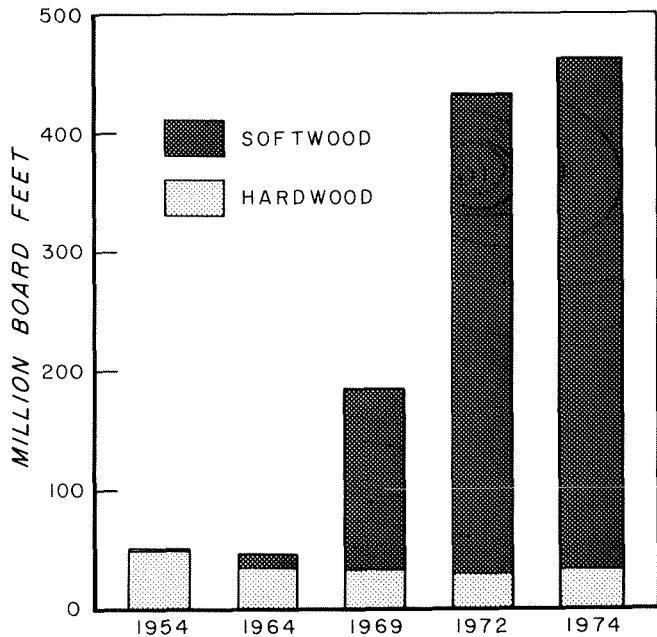

Figure 3.—Softwood and hardwood veneer log production, 1954-1974.

Before the introduction of pine plywood, softwood made up less than 1 percent of East Texas' annual veneer log harvest. In 1964, two pine plywood plants began limited production, and softwoods accounted for 22 percent of the 43 million board feet of veneer logs harvested. By 1969, there were six plywood plants in operation; veneer log harvest had quadrupled, and softwoods increased to 82 percent. The area's veneer log production rose to 460 million board feet in 1974, and softwoods accounted for 95 percent of the total. The nine plywood plants processed 390 million board feet of pine veneer logs, which is over 99 percent of all the softwood veneer volume and 94 percent of the total volume manufactured in East Texas. Two plywood plants began operation in the last months of the year and had only a minor inventory in 1974. The average production of the seven plants in full operation was 54 million board feet.

Hardwood veneer production has been declining for the past two decades along with the number of plants. In 1954, East Texas harvested 50 million board feet of hardwood veneer logs, and 21 veneer plants were in operation. By 1964, the volume dropped to 34 million board feet, and the number of mills was reduced to 16. The 1974 harvest was 21 million board feet, and there were 11 plants. Including imported logs, the hardwood veneer plants processed over 25 million board feet in 1974; about 60 percent was processed by the two face veneer plants.

East Texas veneer plants imported 5 million board feet of veneer logs, and the area exported 50 million board feet, all pine, to surrounding States. The industry converted 84 percent of its coarse residues into pulp chips and produced 64 million board feet of studs from veneer cores.

OTHER PRODUCTS

All other products accounted for just over 1 percent of the total East Texas roundwood harvest. Over half of the volume was converted into poles, and the remainder went to such products as piling, posts, cooperage, handlestock, furniture stock, and other industrial items.

PLANT RESIDUES

In converting roundwood into primary products, East Texas forest industries generated 135

million cubic feet of various wood residues. Three-fourths of this volume was in coarse items such as slabs, edgings, cull pieces, and other material suitable for conversion into pulp chips. The rest was comprised of finer particles such as sawdust and shavings.

Forest industries converted 95 percent of their coarse and 80 percent of their fine wood residues into plant byproducts in 1974. Pulp chips for fiber was the prevalent use of coarse residues, and over half of the fine residues were pulped. The acceptance of fine particles by pulpmills has increased in recent years.

Over 100 million cubic feet of plant byproducts went into the production of pulp. Another 11 million cubic feet were burned for domestic and industrial fuel. Twelve million cubic feet were used for miscellaneous purposes such as studs, charcoal, animal bedding, and soil mulch (fig. 4).

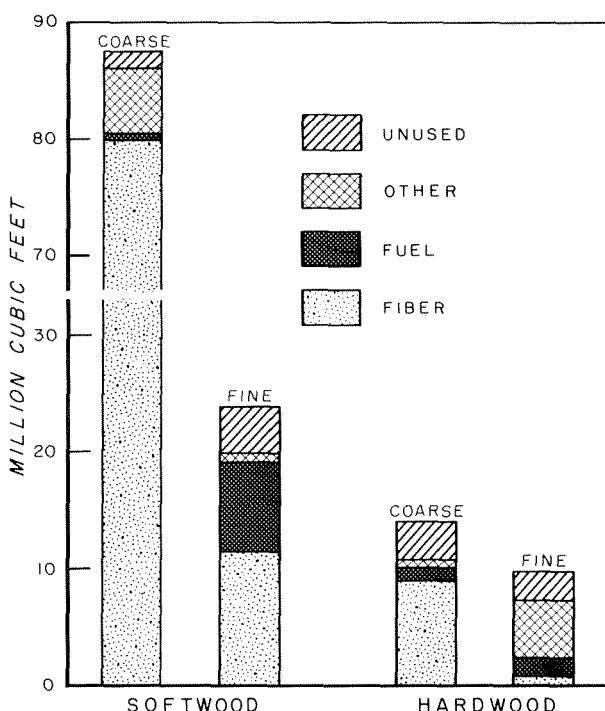

Figure 4.—Use of East Texas plant residues, 1974.

Over 1.2 million tons of bark were accumulated by East Texas forest industries in 1974. Over 85 percent of this volume was utilized; industrial fuel accounted for 88 percent of bark use. Other uses were for charcoal, domestic fuel, animal bedding, and soil mulch. The remaining 184,000 tons of bark went unused.

Bertelson, Daniel F.

1975. East Texas forest industries, 1974. South. For. Exp. Stn., New Orleans, La. 20 p. (USDA For. Serv. Resour. Bull. SO-57)

East Texas forests supplied more than 456 million cubic feet of roundwood to forest industries in 1974. Pulpwood and saw logs were the major products, accounting for 83 percent of the harvest. A total of 202 primary wood-using plants were in operation in 1974.

Additional keywords: Forest industries, pulpwood, saw logs, veneer, residues.
