TIMBER REMOVALS	27, 28
MORTALITY	29

Acknowledgement

Generous assistance from public and private organizations made it possible to keep the field work for the latest forest inventory of Mississippi ahead of the schedule that could have been maintained with regularly allotted funds. The very material aid of the organizations listed below, and of the individuals in them, is gratefully acknowledged:

Forest Statistics for Mississippi Counties

Prepared by
Staff:
Renewable Resources
Evaluation Research
Work Unit

This report tabulates information from a new forest survey of Mississippi completed in 1977 by the Renewable Resources Evaluation Research Unit of the Southern Forest Experiment Station. The tables are intended for use as source data in compiling estimates for groups of counties. Because the sampling procedure is intended primarily to furnish inventory data for the State as a whole, estimates for individual counties have limited and variable accuracy.

The data on forest acreage and timber volume were secured by a systematic sampling method involving a forest-nonforest classification on aerial photographs and on-the-ground measurements of trees at sample locations. The sample locations were at the intersections of a grid of lines spaced 3 miles apart. At each forested location, 10 point samples were uniformly distributed on an area of about 1 acre.

The sampling errors to which the State area and volume totals are liable (on a probability of two chances out of three) are indicated in table 1.

Table 1.—*Sampling errors for forest land and volume estimates*

Item	Sampling error
	----- Percent -----
Commercial forest land	0.3
Growing-stock volume	1.4
Sawtimber volume ¹	1.9
Growth on growing stock	1.5
Growth on sawtimber	2.2
Removals from growing stock	1.6
Removals from sawtimber	2.3

¹International ¼-inch rule.

Detailed sampling errors are shown in tables 39 through 43. An approximation of sampling errors for groups of counties may be obtained using the formula:

$$e = \frac{(SE) \sqrt{(\text{Specified volume or area})}}{\sqrt{(\text{Volume or area total in question})}}$$

Where: e = Estimated sampling error of the volume or area total in question.

SE = Specified sampling error for the State.

When data for two or more counties are grouped the error decreases. Conversely, as data for individual counties are broken down by various subdivisions, the possibility of error increases and is greatest for the smallest items.

Because of differences in standards of tree measurement, direct comparisons cannot be made between the estimates in this report and those from a prior inventory in 1967. In table 2, changes between the two surveys are summarized in terms of current measurement standards.

Definitions of Terms

Acceptable trees.—Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

Commercial forest land.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization.

Desirable trees.—Growing-stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

Table 2.—Commercial forest area, growing-stock, and sawtimber volume, 1977, and change since 1967

Resource region	Commercial forest		Growing stock				Sawtimber

¹Based on current measurement standards.

²Negligible.

Forest type.—A classification of forest land based upon the species forming a plurality of live-tree stocking.

Growing-stock trees.—Live trees that are of commercial species and qualify as desirable or acceptable trees.

Growing-stock volume.—Net volume in cubic feet of growing-stock trees at least 5.0 inches in diameter at breast height, from a 1-foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

Mortality.—Sound-wood volume of live trees dying from natural causes during a specified period.

Net annual growth.—The increase in volume of a specified size class for a specific year.

Noncommercial species.—Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Physiographic site.—A classification of forest land according to its suitability for growing certain species groups—pines, upland hardwoods, or bottom land hardwoods.

Poletimber trees.—Growing-stock trees of commercial species at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

Rotten trees.—Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of rot.

Rough trees.—Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of roughness or poor form. (Includes all live trees of noncommercial species.)

Sawtimber trees.—Live trees that are of commercial species, contain at least a 12-foot saw log, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

Sawtimber volume.—Net volume of the saw-log portion of live sawtimber in board feet, International $\frac{1}{4}$ -inch rule.

Site class.—A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

Stand-size class.—A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber, or seedlings and saplings.

Timber removals.—The net volume of growing-stock trees removed from the inventory by harvesting, cultural operations such as timber-stand improvement, land clearing, or changes in land use.

Staff of Renewable Resources Evaluation Research Work
Unit, Southern Forest Experiment Station.

1978. Forest Statistics for Mississippi Counties. U.S.
Dep. Agric. For. Serv. Resour. Bull. SO-69, 86 p.
South. For. Exp. Stn., New Orleans, La.

This report tabulates forest resource information, as of January 1,
1977, from a new inventory of counties in Mississippi.

Additional keywords: Area, volume, forest type, stand-size, ownership,
growth, removals, mortality.
