Forest Statistics for Southeast Alabama Counties

Staff: Forest Inventory and Analysis Research Work Unit

FOREST STATISTICS FOR SOUTHEAST ALABAMA COUNTIES

Staff: Forest Inventory and Analysis Research Work Unit

These tables were derived from data obtained during a 1982 inventory of 21 counties comprising the Southeast Unit of Alabama (fig. 1). The data on forest acreage and timber volume were secured by a systematic sampling method involving a forest-nonforest classification on aerial photographs and on-the-ground measurements of trees at sample locations. The sample locations were at the intersections of a grid of lines spaced 3 miles apart. At each forest location, per acre estimates were obtained from 5 BA 37.5 point samples.

Table 1.--Sampling errors¹ for forest land and timber volume, 1982

County	Commercial forest land	Growing stock	Sawtimber
----- percent -----			
Autauga	2	14	17

Dale	3	12	16
Dallas	2	11	15
Elmore	3	15	20
Geneva	3	17	24
Henry	2	13	16
Houston	2	18	26
Lee	3	13	17
Lowndes	2	13	19
Macon	3	15	19
Montgomery	3	13	17
Pike	3	15	19
Russell	3	12	16
Tallapoosa	2	11	15
All counties	0.6	2.8	3.7

¹ By random-sampling formula.

The sampling methods were developed to provide suitable State estimates. Estimates for smaller areas are presented, but sampling error increases as the area considered decreases. Sampling errors given in table 1 are based on one standard deviation or a probability of two chances out of three. To estimate the sampling error for a combination of counties one can use the following:

$$\text{SEG} = \frac{\text{SET} \sqrt{X_T}}{\sqrt{X_G}}$$

where:

SE = standard error of estimate (%)

X = variable of interest (area, volume)

G = group of counties to be combined

T = total for the unit

Sampling errors for estimates of the principal timber species are shown in table 2.

DEFINITIONS OF TERMS

Acceptable trees.--Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

Commercial forest land.--Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization.

Desirable trees.--Growing stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

Forest type.--A classification of forest land based upon the species forming a plurality of live-tree stocking.

Growing-stock trees.--Live trees that are of commercial species and qualify as desirable or acceptable trees.

Growing stock volume.--Net volume in cubic feet of growing-stock trees at least 5.0 inches in diameter at breast height, from a 1 foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

Noncommercial species.--Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Physiographic site.--A classification of forest land according to its suitability for growing certain species groups--pine, upland hardwood, or bottom-land hardwood.

Poletimber trees.--Growing-stock trees of commercial species at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

Rotten trees.--Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of rot.

Rough trees.--Live trees of commercial species that do not contain at least one 12-foot saw log, now or respectively, primarily because of roughness or poor form. (Includes all live trees of non-commercial species).

Sawtimber trees.--Live trees that are of commercial species, contain at least a 12-foot saw log, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

Sawtimber volume.--Net volume of the sawlog portion of live sawtimber in board feet, International 1/4-inch rule and in cubic feet.

Site class.--A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

Stand-size class.--A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber, or sapling and seedling.

Table 2.--Sampling errors for timber volume by species, 1982

Species	Growing stock	Sawtimber
----- percent -----		
Softwood:		
Longleaf pine	18	19
Slash pine	21	23

STAFF OF FOREST INVENTORY AND ANALYSIS WORK
UNIT, SOUTHERN FOREST EXPERIMENT STATION.

1983. Forest statistics for Southeast
Alabama counties. U.S. Dep. Agric. For.
Serv. Resourc. Bull. SO-94 18p. South. For.
Exp. Stn., New Orleans, La.

Tabulates forest resource information from a new
inventory of the Southeast Unit of Alabama.

Addition Keywords: Area, volume forest-type,
stand-size, ownership.
