Forest Statistics for North Carolina, 1984

William A. Bechtold, Resource Analyst
Forest Inventory and Analysis
Asheville, North Carolina

Foreword

This report highlights the principal findings of the fifth forest survey of North Carolina. Fieldwork began in November 1982 and was completed in September 1984. Four previous surveys, completed in 1938, 1956, 1964, and 1974, provide statistics for measuring changes and trends over the past 46 years. The primary emphasis in this report is on the changes and trends since 1974. Previously reported figures have been adjusted to provide the best estimate of change.

Periodic surveys of the forest resource are authorized by the Forest and Range-land Renewable Resources Research Act of 1978. These surveys are a continuing, nationwide undertaking by the Regional Experiment Stations of the USDA Forest Service. In Florida, Georgia, North Carolina, South Carolina, and Virginia, these surveys are administered by the Forest Inventory and Analysis (Forest Survey) Research Work Unit at the Southeastern Forest Experiment Station, with headquarters in Asheville, NC. The primary objective of the survey is to periodically inventory and evaluate all forest and related resources. These multiresource data help provide a basis for formulating forest policies and programs and for the orderly development and use of the resources. This

report deals only with the extent and condition of forest lands, associated timber volumes, and rates of timber growth and removals.

Reports for the survey units in North Carolina, USDA Forest Service Resource Bulletins SE-72, SE-74, and SE-76, have been issued for the Southern Coastal Plain, Northern Coastal Plain, and Piedmont. A similar report for the Mountains is being released with this report. An in-depth, analytical State report should be available in late 1985.

The Southeastern Station gratefully acknowledges the cooperation and assistance provided by the North Carolina Forest Service of the State Department of Natural and Economic Resources and the Tennessee Valley Authority in collecting field data. Appreciation is also expressed for the excellent cooperation of other public agencies, forest industry, and other private landowners in providing information and access to the sample locations.

Since the fourth inventory of North Carolina's forest resources was completed in 1974

- area of commercial forest declined from 19.5 to 18.5 million acres. About 1.4 million acres were removed from the forest land base, whereas only 0.3 million acres were added. Of the acreage diverted to other uses, 52 percent went to agriculture, 34 percent to urban and other nonforest uses, 9 percent to water, and 5 percent to noncommercial forest. Reductions of timberland were measured in all survey units, but almost half the net loss occurred in the Piedmont. Statewide, 60 percent of the total land area is currently classified as timberland.

- timberland owned by farmers decreased from 8.4 to 5.5 million acres, or by 35 percent. Occupational change, land transaction, clearing for agriculture, and incorporation of small family farms all contribute to the reduction of farmer-owned timberland. Forest acreage held by all other owners increased over the period. Corporate owners (excluding forest industry) added 0.5 million acres to a previous base of 1.1 million acres for a 46-percent gain. Miscellaneous private individuals acquired another 1.0 million acres and now own 6.9 million acres of commercial forest. Together, these three groups form the nonindustrial private forest (NIPF) ownership class. Although the heavy loss of farmer-owned timberland led to a net decline of 9 percent in the NIPF grouping, these owners currently possess 76 percent of the timberland in North Carolina. Forest industry added 0.2 million acres to their fee-simple holdings and now own 14 percent of the State's commercial forests. They also control another 1 percent under long-term lease. About 6 percent of North Carolina's timberland is managed by the National Forest System. The balance is owned by various other public agencies.

- more than 2.5 million acres, or nearly 14 percent of the total commercial forest, were harvested and retained in timberland. About 76 percent of the final harvest occurred on

NIPF land, 20 percent on lands controlled by forest industry, and 4 percent on public land. The average number of acres harvested annually has increased by 12 percent since the period between 1964 and 1974. This is attributable to a 24-percent increase on NIPF lands, as harvest rates on forest industry and public lands have dropped by 13 and 16 percent. About 48 percent of the final harvest occurred in pine stands, 13 percent in oak-pine, and 39 percent in hardwood stands.

- more than 2.1 million acres were regenerated, either naturally or artificially, to manageable stands of growing-stock trees. Approximately 43 percent of these new stands resulted in pine forest types, 15 percent in oak-pine, and 42 percent in hardwood types. In all, 0.7 million acres have been planted during the remeasurement period. The current planting rate, 74,000 acres per year, is the same as 10 years ago. However, the area planted annually to pines on NIPF land climbed by 84 percent, to 28,000 acres. Reforestation programs sponsored by the State and accelerating rates of harvest on these lands are probably key factors. On the other hand, slower rates of harvest have correspondingly reduced forest industry planting rates by 23 percent, to 42,000 acres each year. Although increased planting rates on NIPF lands are encouraging, a substantial planting deficit still exists. NIPF owners account for 68 percent of the total pine acreage harvested and retained as forest, yet they replaced the equivalent of only 26 percent of this acreage with adequately stocked pine plantations. In contrast, forest industry artificially regenerated 19 percent more pine acreage than they harvested.

- little change has taken place in the overall percentages of pine, oak-pine, and hardwood acreage. Declines in the total forest land base have eroded the acres assigned to each of these broad forest types somewhat proportionately. Thirty-five percent of the State's total forest acres has again been assigned a pine forest type, 12 percent is classified as oak-pine, and 53 percent falls under the hardwood category.

Within the pine broad forest type, the area of slash, loblolly, and white pine-hemlock detailed forest types has increased moderately. Longleaf, shortleaf, Virginia, and pond pine forest types have all lost ground. Among detailed forest types, the most notable change was a 454,000-acre reduction of pond pine.

• average basal area of all-live trees 5.0 inches d.b.h. and larger has increased from 67 to 78 square feet per acre. Growing-stock trees make up 90 percent of the total. Average stocking levels have improved considerably since the previous survey. In 1974, 29 percent of all commercial forest acres were classed as fully stocked, 49 percent as medium stocked, and 22 percent as poorly stocked with growing-stock trees. The breakdown now is 43 percent fully stocked, 43 percent medium stocked, and 14 percent poorly stocked. On the whole, North Carolina's timberlands are more densely stocked with growing-stock trees than any other Southeastern State.

• the number of all-live yellow pines has declined by 40 percent in the 2-inch class, 22 percent in the 4-inch class, and 4 percent in the 6-inch class. On NIPF land, reductions of yellow pines were evident through the 10-inch class. Despite improved planting efforts, NIPF owners have been unable to replace the large influx of natural pines established on abandoned farmland more than 20 years ago. On forest industry land, significant yellow pine losses were apparent in the 2-inch class only, which fell by 41 percent. Surprisingly, the number of all-live hardwoods in the smaller diameter classes has also decreased substantially. Nearly all the hardwood decline occurred on NIPF land, where reductions were found through the 10-inch class. Traditionally, long hardwood rotations, causing an accumulation of hardwoods in the larger diameter classes, and higher rates of small-diameter hardwood mortality both contribute to this decline. Consistent with losses in the smaller diameter classes, the area of all sapling-seedling stands fell from 4.6 to 3.9 million acres, and poletimber

stands from 6.3 to 5.3 million acres. The area of stands dominated by sawtimber-size trees spread from 8.2 to 9.0 million acres.

• softwood growing-stock volume rose from 10.5 to 11.2 billion cubic feet. This 7-percent rate of expansion is less than half the rate measured between 1964 and 1974. Increases were recorded in all diameter classes except the 6-inch class. Loblolly pine is the dominant species in the State, with 50 percent of the total softwood growing-stock volume. Over the remeasurement period, loblolly growing-stock volume escalated by 12 percent and supported half the total softwood increase. Virginia and white pine contributed another 29 percent to the total softwood gain. Slash pine, still a relatively minor species in North Carolina, showed a fivefold volume increase. Shortleaf pine lost more volume than any other species and declined by 17 percent. Pond pine volume fell by 18 percent. The current inventory of softwood growing stock includes 38.9 billion board feet of sawtimber, a boost of 10 percent.

• hardwood growing-stock volume climbed from 15.6 to 17.7 billion cubic feet, or by 14 percent. The rate of hardwood volume expansion is also slowing, due mainly to reductions in the 6- and 8-inch diameter classes. Yellow-poplar and red maple were responsible for 52 percent of the total increase. Oaks accounted for another 22 percent of the gain. Altogether, hardwoods contribute 61 percent to the total growing-stock volume. The current inventory of hardwood growing stock includes 52.9 billion board feet of sawtimber, a 23-percent increase.

In 1983

• net annual growth of softwood growing stock was down by 7 percent, from 536 to 501 million cubic feet. A 21-percent softwood growth loss on NIPF land offset a 98-percent increase on forest industry land to render the net decline. In the Piedmont and Mountains where NIPF ownership is more concentrated, reduced ingrowth, higher mortality, slowing growth rates of survivor

trees, and land clearing all combined to produce the net loss for the State. Pine plantations on forest industry land have mitigated these factors in the two Coastal Plain units, where softwood net annual growth was up by 18 percent. Despite higher mortality and less ingrowth, hardwood net growth increased by 6 percent across the State, to 627 million cubic feet annually. Net annual growth of hardwoods and softwoods together totaled 1.1 billion cubic feet. This growth included 4.6 billion board feet of sawtimber.

• annual removals of all growing-stock trees totaled 746 million cubic feet.

Softwood removals were down by about 1 percent and hardwood removals remained stable. Removals averaged 86 percent of net annual growth for softwood growing-stock, and 50 percent for hardwoods. A healthy margin of hardwood growth over removals exists in most of the State; but declining growth has made the situation tight for softwoods in the Piedmont, where the annual softwood growth surplus plummeted from 73.8 to 9.4 million cubic feet and removals averaged 93 percent of net growth. Circumstances have improved in the Northern Coastal

Plain, where softwood growth and removals are now in balance. In 1973, softwood removals exceeded growth by 22 million cubic feet in this region. In the Southern Coastal Plain and Mountains, annual softwood growing-stock removals averaged 73 and 79 percent of net growth. By ownership, softwood removals averaged 58 percent of growth on forest industry land. On NIPF land, however, a 124 million cubic-foot surplus dissipated to a 0.5 million cubic-foot softwood overcut. Annual growing-stock removals of all species on all ownerships included 2.8 billion board feet of sawtimber.

• mortality of growing-stock trees increased by 36 percent and totaled 191 million cubic feet. Softwood mortality rose by 51 percent and hardwood growing-stock mortality by 19 percent. The annual mortality increase was evident in all regions of the State, but was more pronounced in the Piedmont and Mountains. The leading identifiable causes of death for softwoods were insects and suppression. Disease was the major cause of death for hardwoods. Mortality of all growing-stock trees reduced gross growth by 15 percent.

How the Inventory is Made

The method of the inventory is a sampling procedure designed to provide reliable statistics primarily at the State and Survey Unit levels. Individual county statistics are presented so that any combination of counties may be added together until a total is large enough to meet the desired degree of reliability. Procedures were as follows:

1. Initial estimates of forest and nonforest areas were based on the classification of 91,765 sample clusters systematically spaced on the latest aerial photographs available. A subsample of 8,123 of the 16-point clusters was ground checked, and a linear regression was fitted to the data to develop the relationship between the photo and ground classification of the subsample. This procedure provides a means for adjusting the initial estimates of area for change in land use since date of photography and for photo misclassifications.

2. Estimates of timber volume and forest classifications were based on measurements recorded at 5,355 ground sample locations systematically distributed within the commercial forest land. The plot design at each location was based on a cluster of 10 points. In most cases, variable plots established with the use of a 37.5 BAF prism, were systematically spaced within a single forest condition at 5 of the 10 cluster points. Trees less than 5 inches d.b.h. were tallied on a fixed-radius plot around each point center.

3. Equations prepared from detailed measurements collected on standing trees in this Unit, and similar measurements taken throughout the Southeast, were used to compute the volume of individual tally trees. A mirror caliper and sectional aluminum poles were used to obtain the additional measurements on these standing trees required to develop volume equations.

4. Felled trees were measured at 100 active cutting operations. These data will supplement the standing-tree volume data and be used to generate utilization factors for product and species groups. Forest biomass estimates were made by using equations developed by the Utilization of Southern Timber Research Work Unit of the Southeastern Forest Experiment Station in Athens, GA.

5. Estimates of growth, removals, and mortality were determined from the remeasurement of 4,878 permanent sample plots established in the fourth survey.

6. Ownership information was collected from correspondence, public records, and local contacts. In those counties where the sample missed a particular ownership class, temporary sample plots were added on these lands.

7. All field data were sent to Asheville for editing and were entered into disk and magnetic-tape storage for processing. Final estimates were based on statistical summaries of the data.

Reliability of the Data

Statistical analysis of these data indicates the following sampling errors in terms of one standard error (two times out of three):

	<u>Percent</u>
Per million acres of commercial forest land	0.93
Per billion cubic feet of growing stock	5.76
Per billion cubic feet of net annual growth	1.12
Per billion cubic feet of annual removals	2.99

^aSampling error of breakdowns of county and State totals may be computed with the following formula:

$$E = \frac{(SE) \sqrt{(\text{specified volume or area})}}{\sqrt{(\text{volume or area total in question})}}$$

Where: E = Sampling error of the volume or area total in question

SE = Specified sampling error in table.

^bBy random-sampling formula (in percent).

Definitions of Terms

All live trees. All trees 1.0 inch d.b.h. and larger which are not dead at the time of inventory.

All live-tree volume. Volume (cubic feet) of wood above the ground line in all live trees 1.0 inch d.b.h. and larger. The volume in twigs and lateral limbs smaller than 0.5 inch in diameter at the point of occurrence on sapling-size trees is included, but is excluded on poletimber and sawtimber-size trees.

Allowable cut. The volume of timber that could be cut on commercial forest land during a given period under specified management plans aimed at sustained production of timber products.

Basal area. The area in square feet of the cross section at breast height of a single tree or of all the trees in a stand, usually expressed as square feet of basal area per acre.

Biomass. The aboveground green weight of solid wood and bark in all live trees 1.0 inch d.b.h. and larger from the ground to the tip of the tree. All foliage is excluded. The weight of wood and bark in lateral limbs, secondary limbs, and twigs under 0.5 inch in diameter at the point of occurrence on sapling-size trees is included, but is excluded on poletimber and sawtimber-size trees.

Bole. That portion of a tree between a 1-foot stump and a 4-inch top diameter outside bark (d.o.b.) in trees 5.0 inches d.b.h. and larger.

Broad management class. A classification of commercial forest land based on forest type and stand origin.

Pine plantation. Stands that have been artificially regenerated by planting or direct seeding and with a southern yellow pine, white pine-hemlock, or other softwood forest type.

Natural pine. Stands that have not been artificially regenerated and

with a southern yellow pine, white pine-hemlock, or other softwood forest type.

Oak-pine. Stands with a forest type of oak-pine.

Upland hardwood. Stands with a forest type of oak-hickory, chestnut oak, southern scrub oak, or maple-beech-birch.

Lowland hardwood. Stands with a forest type of oak-gum-cypress, elm-ash-cottonwood, palm, or other tropical.

Bureau of Land Management lands. Federal lands administered by the Bureau of Land Management.

Census water. Streams, sloughs, estuaries, canals, and other moving bodies of water one-eighth of a statute mile in width and greater, and lakes, reservoirs, ponds, and other permanent bodies of water 40 acres in area and greater.

Commercial forest land. Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, not currently developed for nonforest use, capable of producing 20 cubic feet of industrial wood per acre per year and not withdrawn from timber utilization by legislative action.

Commercial species. Tree species conventionally regarded as being able to develop into trees suitable for the manufacture of industrial timber products. Species that typically exhibit small size, poor form, or inferior quality are excluded.

Cropland. Land under cultivation within the past 24 months, including orchards and land in soil-improving crops, but excluding land cultivated in developing improved pasture. Also includes idle farmland.

D.b.h. Tree diameter (outside bark) at breast height (4.5 feet above the ground).

Diameter class. A classification of trees based on tree d.b.h. Two-inch diameter classes are commonly used by Forest Inventory and Analysis, with the even inch as the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h., inclusive.

Farm. Land on which agricultural operations are being conducted and sale of agricultural products totaled \$1,000 or more during the year.

Farm operator. A person who operates a farm, either doing the work himself or directly supervising the work.

Farmer-owned land (see: Other private land).

Forest industry land. Land owned by companies or individuals operating wood-using plants.

Forest industry leased land. Land leased or under management contracts to forest industry from other owners for periods of one forest rotation or longer. Land under cutting contracts is not included.

Forest land. Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, and not currently developed for non-forest use.

Forest type. A classification of forest land based on the species forming a plurality of live-tree stocking.

White pine-hemlock. Forests in which eastern white pine, red pine, or jack pine, singly or in combination, constitute a plurality of the stocking. (Common associates include hemlock, birch, and maple.)

Spruce-fir. Forests in which spruce or true firs, singly or in combination, constitute a plurality of the stocking. (Common associates include maple, birch, and hemlock.)

Longleaf-slash pine. Forests in which longleaf or slash pine, singly or in

combination, constitute a plurality of the stocking. (Common associates include oak, hickory, and gum.)

Loblolly-shortleaf pine. Forests in which loblolly pine, shortleaf pine, or other southern yellow pines, except longleaf or slash pine, singly or in combination, constitute a plurality of the stocking. (Common associates include oak, hickory, and gum.)

Oak-pine. Forests in which hardwoods (usually upland oaks) constitute a plurality of the stocking but in which pines account for 25 to 50 percent of the stocking. (Common associates include gum, hickory, and yellow-poplar.)

Oak-hickory. Forests in which upland oaks or hickory, singly or in combination, constitute a plurality of the stocking, except where pines account for 25 to 50 percent, in which case the stand would be classified oak-pine. (Common associates include yellow-poplar, elm, maple, and black walnut.)

Oak-gum-cypress. Bottom-land forests in which tupelo, blackgum, sweetgum, oaks, or southern cypress, singly or in combination, constitute a plurality of the stocking, except where pines account for 25 to 50 percent, in which case the stand would be classified oak-pine. (Common associates include cottonwood, willow, ash, elm, hackberry, and maple.)

Elm-ash-cottonwood. Forests in which elm, ash, or cottonwood, singly or in combination, constitute a plurality of the stocking. (Common associates include willow, sycamore, beech, and maple.)

Maple-beech-birch. Forests in which maple, beech, or yellow birch, singly or in combination, constitute a plurality of the stocking. (Common associates include hemlock, elm, basswood, and white pine.)

Palm, other tropical. Forests in which palms and other tropicals constitute a plurality of the stocking.

Gross growth. Annual increase in merchantable volume of trees in the absence of cutting and mortality. (Gross growth includes survivor growth, ingrowth, growth on ingrowth, growth on removals prior to removal, and growth on mortality prior to death.)

Growing-stock trees. Live sawtimber-size trees of commercial species containing at least a 12-foot log, or two noncontiguous saw logs each 8 feet or longer, meeting minimum grade requirements (hardwoods must qualify as either a log grade of 3 or 4; softwoods must qualify as a log grade 3) with at least one-third of the gross board-foot volume (International 1/4-inch rule) between a 1-foot stump and the minimum saw-log top being sound, or a live tree below sawtimber size that will prospectively qualify under the above standards.

Desirable tree. A tree that qualifies as growing stock and has no serious defects in quality limiting present or prospective use; is of relatively high vigor (30 percent or more live crown ratio); is compatible with the site and physiographic class; has a total board-foot loss not to exceed 15 percent in softwoods or 25 percent in hardwoods as a result of severe sweep, crook, or lean; and has a relatively clear bole.

Acceptable tree. A tree that qualifies as growing stock but does not meet the minimum requirements to qualify as a desirable tree. Included are sawtimber-size trees that do not contain a 12-foot saw log because of excessive, natural taper in the butt log, but have the potential to produce a 12-foot saw log as diameter increases.

Growing-stock volume. Volume (cubic feet) of solid wood in growing-stock trees 5.0 inches d.b.h. and larger,

from a 1-foot stump to a minimum 4.0-inch top diameter, outside bark, on the central stem. Volume of solid wood in primary forks from the point of occurrence to a minimum 4.0-inch top diameter outside bark is included.

Hardwoods. Angiosperms; dicotyledonous trees (including all palm species which are monocotyledonous), usually broadleaf and deciduous.

Soft hardwoods. Soft-textured hardwoods such as boxelder, red and silver maples, hackberry, loblolly-bay, sweetgum, yellow-poplar, magnolia, sweetbay, water tupelo, black-gum, sycamore, cottonwood, black cherry, willow, basswood, and elm.

Hard hardwoods. Hard-textured hardwoods such as sugar maple, birch, hickory, dogwood, persimmon (forest grown), black locust, beech, ash, honeylocust, holly, black walnut, mulberry, and all commercial oaks.

Idle farmland. Land including former cropland, orchard, improved pasture, and farm sites not tended within the past 2 years, and currently less than 16.7 percent stocked with live trees.

Improved pasture. Land currently improved for grazing by cultivation, seeding, irrigation, or clearing of trees or brush.

Indian land. All lands held in trust by the United States for individual Indians or tribes, or all lands, titles to which are held by individual Indians or tribes, subject to Federal restrictions against alienation.

Industrial wood. All roundwood products except fuelwood.

Ingrowth. The number or net volume of trees that grow large enough during a specified year to qualify as saplings, poletimber, or sawtimber.

Inhibiting vegetation. Cover sufficiently dense to prevent the establishment of tree seedlings.

Land area. The area of dry land and land temporarily or partly covered by water such as marshes, swamps, and river flood plains (omitting tidal flats below mean high tide), streams, sloughs, estuaries, and canals less than one-eighth of a statute mile in width, and lakes, reservoirs, and ponds less than 40 acres in area.

Log grade. A classification of logs based on external characteristics as indicators of quality or value.

Logging residues. The unused merchantable portion of growing-stock trees cut or destroyed during logging operations.

Logging slash. The unmerchantable portion of growing-stock trees (including saplings) plus all cull trees 1.0 inch d.b.h. and larger cut or destroyed during logging operations and not used.

Manageable stand. Commercial forest land at least 60 percent stocked with growing-stock trees that can be featured together under a management scheme.

Merchantable portion. That portion of all live trees 5.0 inches d.b.h. and larger between a 1-foot stump and a minimum 4.0-inch top diameter outside bark on the central stem. That portion of primary forks from the point of occurrence to a minimum 4.0-inch top diameter outside bark is included.

Merchantable volume. Solid-wood volume in merchantable portion of all live trees.

Miscellaneous Federal land. Federal land other than National Forests, land administered by the Bureau of Land Management, and land administered by the Bureau of Indian Affairs.

Miscellaneous private land (see: Other private land).

Mortality. The merchantable volume in trees that have died from natural causes during a specified period.

National Forest land. Federal land that has been legally designated as National Forests or purchase units, and other land under the administration of the Forest Service, including experimental areas and Bankhead-Jones Title III land.

Net annual growth. The net change in merchantable volume for a specific year in the absence of cutting (gross growth minus mortality for that specified year.)

Net volume. Gross volume of wood less deductions for rot, sweep, or other defect affecting use for timber products.

Noncommercial forest land. Forest land not considered commercial. Includes both unproductive forest land and productive-reserved forest land.

Noncommercial species. Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Nonforest land. Land that has never supported forests and land formerly forested where timber production is precluded by development for other uses.

Nonindustrial private forest (NIPF) land. (see: Other private land).

Nonstocked forest land. Commercial forest land less than 16.7 percent stocked with growing-stock trees.

Other private land. Privately owned land excluding forest industry land or forest industry leased land. Also referred to as nonindustrial private forest (NIPF) land.

Farmer-owned land. Owned by farm operators excluding incorporated farm ownerships.

Other individual land. Owned by individuals other than farm operators.

Other corporate land. Owned by corporations, including incorporated farm ownerships.

Other removals. The growing-stock volume of trees removed from the inventory by cultural operations such as timber stand improvement, land clearing, and other changes in land use that result in the removal of the trees from the commercial forest.

Plant residues. Wood material generated in the production of timber products at primary manufacturing plants.

Coarse residues. Material, such as slabs, edgings, trim, veneer cores and ends, which is suitable for chipping.

Fine residues. Material, such as sawdust, shavings, and veneer chippings, which is not suitable for chipping.

Plant byproducts. Residues (coarse or fine) utilized in the further manufacture of industrial products or for consumer use, or utilized as fuel.

Unused plant residues. Residues (coarse or fine) that are not used for any product, including fuel.

Poletimber-size trees. All live trees at least 5.0 inches d.b.h. but smaller than sawtimber size.

Productive-reserved forest land. Forest land sufficiently productive to qualify as commercial forest land, but withdrawn from timber utilization through statute or administrative designation.

Quality class. A classification of sawtimber volume by log or tree grades.

Rangeland. Land on which the natural vegetation is predominantly native grasses, grass-like plants, forbs, or shrubs valuable for forage, not qualifying as commercial forest and not developed for another land use. Rangeland includes natural grassland and savannah.

Rotten trees. Live trees of commercial species that do not contain at least one 12-foot saw log, or two noncontiguous saw logs, each 8 feet or longer,

now or prospectively, primarily because of rot or missing sections, and with less than one-third of the gross board-foot tree volume in sound material.

Rough trees. Live trees of commercial species that do not contain at least one 12-foot saw log, or two noncontiguous saw logs, each 8 feet or longer, now or prospectively, primarily because of roughness, poor form, splits, and cracks, and with less than one-third of the gross board-foot tree volume in sound material; and all live trees of noncommercial species.

Roundwood (roundwood logs). Logs, bolts, or other round sections cut from trees for industrial or consumer uses.

Roundwood chipped. Any timber cut primarily for pulpwood, delivered to non-pulp mills, chipped, and then sold to pulp mills as residues, including chipped tops, jump sections, whole trees and pulpwood sticks.

Roundwood products. Any primary product such as lumber, poles, pilings, pulp, or fuelwood which is produced from roundwood.

Salvable dead trees. Standing or down dead trees considered utilizable by Forest Inventory and Analysis standards.

Saplings. Live trees 1.0 to 5.0 inches d.b.h.

Saw log. A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight, and with a minimum diameter inside bark for softwoods of 6 inches (8 inches for hardwoods).

Saw-log portion. That part of the bole of sawtimber trees between a 1-foot stump and the saw-log top, including the portion of forks large enough to contain a saw log.

Saw-log top. The point on the bole of sawtimber trees above which a conventional saw log cannot be produced. The

minimum saw-log top is 7.0 inches in diameter outside bark (d.o.b.) for softwoods and 9.0 inches (d.o.b.) for hardwoods.

Sawtimber-size trees. Softwoods 9.0 inches d.b.h. and larger and hardwoods 11.0 inches d.b.h. and larger.

Sawtimber volume. Growing-stock volume in the saw-log portion of sawtimber-size trees in board feet (International 1/4-inch rule).

Seedlings. Live trees of commercial species less than 1.0 inch d.b.h. that are expected to survive and develop.

Site class. A classification of forest land in terms of inherent capacity to grow crops of industrial wood based on fully stocked natural stands, by annual production capacity.

Class 1. 165 or more cubic feet per acre.

Class 2. 120 to 164 cubic feet per acre.

Class 3. 85 to 119 cubic feet per acre.

Class 4. 50 to 84 cubic feet per acre.

Class 5. 20 to 49 cubic feet per acre.

Softwoods. Gymnosperms; in the order Coniferales, usually evergreen (includes the genus Taxodium which is deciduous), having needles or scalelike leaves.

Pines. Yellow pine species which include loblolly, longleaf, slash, pond, shortleaf, pitch, Virginia, sand, spruce, and Table Mountain pines.

Other softwoods. Cypress, eastern red-cedar, white cedar, eastern white pine, eastern hemlock, spruce, and fir.

Stand-size class. A classification of forest land based on the diameter class

distribution of growing-stock trees in the stand.

Sawtimber stands. Stands at least 16.7 percent stocked with growing-stock trees, with half or more of total stocking in sawtimber and poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

Poletimber stands. Stands at least 16.7 percent stocked with growing-stock trees of which half or more of total stocking is in poletimber and sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

Sapling-seedling stands. Stands at least 16.7 percent stocked with growing-stock trees of which more than half of total stocking is saplings and seedlings.

State, county, and municipal land. Land owned by States, counties, and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

Stocking. The degree of occupancy of land by trees, measured by basal area or the number of trees in a stand and spacing in the stand, compared with a minimum standard, depending on tree size, required to fully utilize the growth potential of the land.

Fully stocked. 100 percent or more stocking.

Medium stocked. 60 to 99 percent stocking.

Poorly stocked. Less than 60 percent stocking.

Survivor growth. The merchantable volume increment on trees 5.0 inches d.b.h. and larger in the inventory at the beginning of the year and surviving to its end.

Timber products. Roundwood products and byproducts.

Timber removals. The merchantable volume of trees removed from the inventory by harvesting, cultural operations such as stand improvement, land clearing, or changes in land use.

Top. The portion of the main stem and forks from a 4.0-inch diameter outside bark to the tips of the main stem and forks, plus all other limbs above the 4.0-inch top at least 0.5 inch in diameter at their point of occurrence.

Treatment opportunity. A classification of the management or treatment that would most improve for timber production the existing condition of the stand being sampled.

Unproductive forest land. Forest land incapable of producing 20 cubic feet

per acre of industrial wood under natural conditions, because of adverse site conditions.

Upper-stem portion. That part of the main stem or fork of sawtimber trees above the saw-log top to minimum top diameter 4.0 inches outside bark or to the point where the main stem or fork breaks into limbs.

Urban and other areas. Areas developed for residential, industrial, or recreational purposes, school yards, cemeteries, roads, railroads, airports, beaches, powerlines and other rights-of-way, or other nonforest land not included in any other specified land use class.

Stocking Standard

D.b.h. class	Minimum number of trees per acre for full stocking	Minimum basal area per acre for full stocking
Seedlings	600	--
2	560	--
4	460	--
6	340	67
8	240	84

12	115	90
14	90	96
16	72	101
18	60	106
20	51	111

Conversion Factors

Cubic feet of wood per average cord
(excluding bark)

D.b.h. class	All species	Pine	Other softwood	Hardwood
6	60.6	61.0	68.2	60.0
8	68.5	68.1	76.0	68.4
10	73.4	73.1	81.4	73.4
12	76.7	76.7	85.2	76.4
14	79.1	79.4	88.2	78.4
16	80.7	81.6	90.4	79.8
18	82.2	83.3	92.3	80.8
20	83.0	84.8	93.8	81.5
22	83.7	86.0	95.1	82.1
24+	85.0	87.8	98.0	83.1
Average	74.9	73.6	86.8	74.8

Metric equivalents of units used in this report

1 acre = 4,046.86 square meters or 0.404686 hectare

1 cubic foot = 0.028317 cubic meter

1 inch = 2.54 centimeters or 0.0254 meter

Breast height = 1.4 meters above ground level

1 square foot = 929.03 square centimeters or 0.0929 square meter

1 square foot per acre basal area = 0.229568 square meter per hectare

1 pound = 0.454 kilogram

1 ton = 0.907 metric ton

County Tables

The county tables are intended for use in compiling forest resource estimates for groups of counties. Because the sampling procedure used by the Forest Survey was intended primarily to furnish inventory data for the survey unit as a whole, individual county estimates have limited and variable accuracy. As county totals are broken down by various subdivisions, the possibility of error increases and is greatest for the smallest items. The order of this increase can be computed with the formula on page 6.

^aTo provide a basis for valid comparisons, adjustments have been made to allow for differences in volume tables and sawtimber specifications used in previous surveys.

^bMerchantable volume.

Bechtold, William A.
Forest statistics for North Carolina, 1984. Resour. Bull. SE-78.
Asheville, NC: U.S. Department of Agriculture, Forest Service,
Southeastern Forest Experiment Station; 1985. 62 pp.

Since 1974 the area of commercial forest declined from 19.5 to 18.5 million acres. Timberland owned by farmers decreased from 8.4 to 5.5 million acres. More than 2.5 million acres were harvested and retained in timberland. Over 2.1 million acres were regenerated to manageable stands of growing-stock trees. Average basal area of all-live trees 5.0 inches d.b.h. and larger increased from 67 to 78 square feet per acre. The number of all-live yellow pine saplings declined considerably. Softwood growing-stock volume rose from 10.5 to 11.2 billion cubic feet; hardwood growing stock, from 15.6 to 17.7 billion cubic feet. In 1983, net annual growth of softwood growing stock was down by 7 percent, to 501 million cubic feet. Hardwood growth increased by 6 percent to 627 million cubic feet. Annual removals of all growing-stock trees totaled 746 million cubic feet. Mortality of growing-stock trees increased by 36 percent and totaled 191 million cubic feet.
