Oklahoma Forest Industries, 1972

Daniel F. Bertelson
Oklahoma Forest Industries, 1972

Daniel F. Bertelson
Primary wood-using plants in Oklahoma, 1972
Oklahoma forests supplied more than 64 million cubic feet of roundwood to forest industries in 1972. Pine made up over three-fourths of the total. In terms of volume harvested, saw logs were the leading product, with pulpwood second (fig. 1). The two combined accounted for 79 percent of the roundwood produced. Veneer logs added 11 percent and posts made up more than half the remainder. A total of 118 wood-using plants were in operation.

Figure 1.—Output of industrial roundwood in Oklahoma, by product, 1972.

More than 99 percent of the softwood came from a five-county region in the southeast corner of the State. Hardwood output was concentrated in the eastern half of the State, but some counties in the west also contributed. McCurtain County, in the extreme southeast, has the most wood-using plants. It also had the largest wood harvest—a total of 44 million feet, or more than two-thirds of the State total.

These are among the major findings of a new canvass of all primary forest industries in Oklahoma. Previous surveys—in 1955 and 1965—covered only forest industries in 17 eastern counties. In 1972, personnel of the Forestry Division of the Oklahoma State Department of Agriculture visited all primary wood-using plants; the canvass was made under supervision of Roger L. Davis. Data were compiled and analyzed by the Forest Resources Research Unit of the Southern Forest Experiment Station.

This report tabulates total production and shows softwood and hardwood output by county. It also lists names and addresses of all primary forest industries; plant locations are mapped on page ii.

SAW LOGS

Oklahoma produced 169 million board feet of saw logs in 1972. This was 43 percent of the total roundwood harvested. Softwoods, exclusively pine, made up 85 percent of the saw-log volume. Oaks and the gums accounted for more than half of the hardwood.

Of the 103 sawmills in operation, seven were large mills that cut a total of 166 million board feet during the year. They processed 83 percent of the lumber manufactured in Oklahoma; more than 99 percent of their output was softwood. The other 96 sawmills were classed as small, in that they individually cut less than 3 million board feet annually. In total, they processed 33 million board feet, of which 81
percent was hardwood. Production of individual mills ranged from 113 million board feet for the largest to 1,300 board feet for a part-time operation.

Oklahoma imported 34 million board feet of saw logs in 1972, and exported 4 million board feet to surrounding States, chiefly Arkansas. At least 20 percent of the saw logs cut within the State were transported over county lines before being sawn into lumber.

PULPWOOD

The 285,654 cords of roundwood cut in 1972 accounted for 36 percent of the State’s timber harvest. This volume was more than triple that in 1971 and more than nine times the harvest a decade ago (fig. 2).

In 1962, Oklahoma had two pulpmills with a daily capability of 140 tons. In 1972, there were three mills with a capacity of 2,270 tons. The largest mill, able to pulp 1,600 tons daily, began operation in 1971 but did not reach full production until 1972.

Two mills, including the new one, are in McCurtain County, and in 1972 more than three-fourths of the round pulpwood cut in the State came from this county. In fact, McCurtain’s production for this year ranked second in the entire South. The harvest in southeastern counties will be further stimulated by opening of a new mill in Texarkana, Texas, and by expansion of a mill in Ashdown, Arkansas.

Hardwoods comprised most of the roundwood cut in 1972, but now softwoods—all pine—comprise two-thirds of the harvest.

In addition to the roundwood, the equivalent of 184,000 cords of Oklahoma plant byproducts was chipped for pulp.

OTHER PRODUCTS

The veneer log harvest in Oklahoma totaled 42 million board feet, accounting for 11 percent of the State’s production. Oklahoma has one veneer plant, which manufactures southern pine plywood. All hardwood veneer logs are sent to mills in other States. The main hardwood veneer species is pecan, but some cottonwood, black walnut, elm, and hackberry logs are also shipped.

Oklahoma produced almost 5.8 million pine posts in 1972, together with 196,000 poles and piling. These roundwood products made up about 7 percent of the timber harvest. The remaining 3 percent went into charcoal wood, handle stock, and excelsior.

PLANT RESIDUES

In converting roundwood into primary products, Oklahoma forest industries generated 23 million cubic feet of residues. Of this volume, 16.3 million was in coarse items such as slabs, edgings, cull pieces, and other material suitable for conversion into pulp chips. The rest consisted of finer particles such as sawdust and shavings. Of the total, 88 percent was converted to useful byproducts.

Pulp chips are the most profitable byproduct, and Oklahoma industries used 85 percent of
their coarse residues for this purpose. Addition of a small quantity of fines brought total use for pulp to 15 million cubic feet. Since the unused coarse residues are largely scattered among small sawmills, it will be difficult to increase the percentage of recovery greatly.

Five million cubic feet, chiefly fines, were put to such miscellaneous purposes as charcoal, animal bedding, and soil mulch. Another 500,000 cubic feet were burned for domestic and industrial fuel. The remaining 3 million cubic feet were mostly fine particles with no market.

Over 273,000 tons of bark were accumulated by Oklahoma wood-using plants in 1972. More than three-fourths was utilized, chiefly as industrial fuel. Small amounts went into charcoal, domestic fuel, animal bedding, and soil mulch.
