

SO-78

Oklahoma Forest Industries, 1978

Victor A. Rudis, and J. Greg Jones

Oklahoma Forest Industries, 1978

Victor A. Rudis and J. Greg Jones

THE REPORT IN BRIEF

Oklahoma supplied 73 million cu ft of roundwood to forest industries in 1978, an increase of 13 percent since 1972, and 35 percent since 1975 (fig. 1). Pine made up four-fifths of the total. Sawlogs and pulpwood were the major products, accounting for 81 percent of the roundwood produced. Veneer logs accounted for 8 percent and the remainder was mostly posts.

Four southeastern counties: Choctaw, LeFlore, McCurtain, and Pushmataha, produced 94 percent of the total output. McCurtain County, which has the most wood using plants, is responsible for nearly half of total production.

Some 81 wood-using plants were operating in 1978 compared with 101 in 1975 and 118 in 1972. The majority of these mills are in the eastern third of the State (see map).

These are the major findings of a new canvass of all primary forest industries in Oklahoma for calendar 1978. The canvass was conducted by personnel at the Department of Forestry, Oklahoma State University-Stillwater, under the supervision of Dr. J. Greg Jones. Data were compiled and analyzed by the Renewable Resources Unit of the Southern Forest Experiment Station.

Results of previous statewide surveys are contained in *Oklahoma Forest Industries, 1972* (RB-SO-45) and *Oklahoma Forest Industries, 1975* (RB-SO-64), available from the Southern Forest Experiment Station.

SAWLOGS

Oklahoma's forest produced 189 million board feet of sawlogs in 1978, a decline of 2 percent since 1975. Softwoods made up 80 percent of the total volume. Oaks accounted for the majority of the hardwood volume.

The number of sawmills in the State has continued to decline since the initial statewide survey in 1972 recorded 103 sawmills in operation. Later surveys recorded 83 operating sawmills in 1975 and only 66 in 1978. Production by large mills (i.e., those cutting at least 3 million boardfeet annually) increased from 83 percent of total sawlogs receipts in 1972 to 87 percent in 1975. In 1978, nine large mills processed 90 percent of the lumber. Large sawmill production was 86 percent softwood, while small sawmill productions was 84 percent hardwoods.

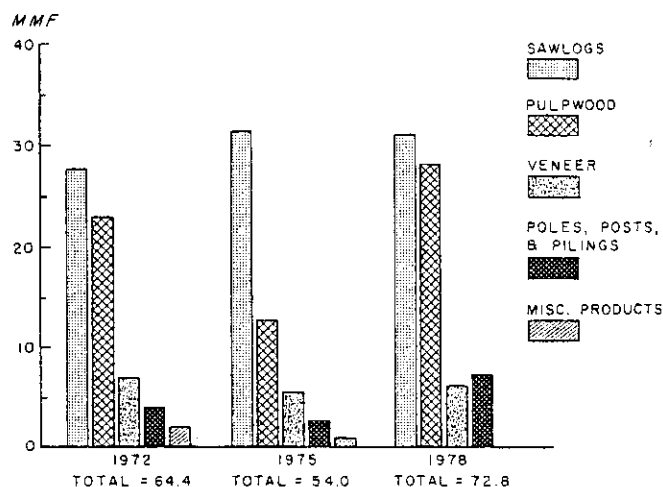

Figure 1.—Output of industrial roundwood 1972-1978.

Oklahoma imported 61 million bd ft of sawlogs in 1978, and exported at least 4 million bd ft to surrounding states. Over 40 percent of the sawlogs cut within the State were transported over county lines before being sawn into lumber.

THOUSAND CORDS

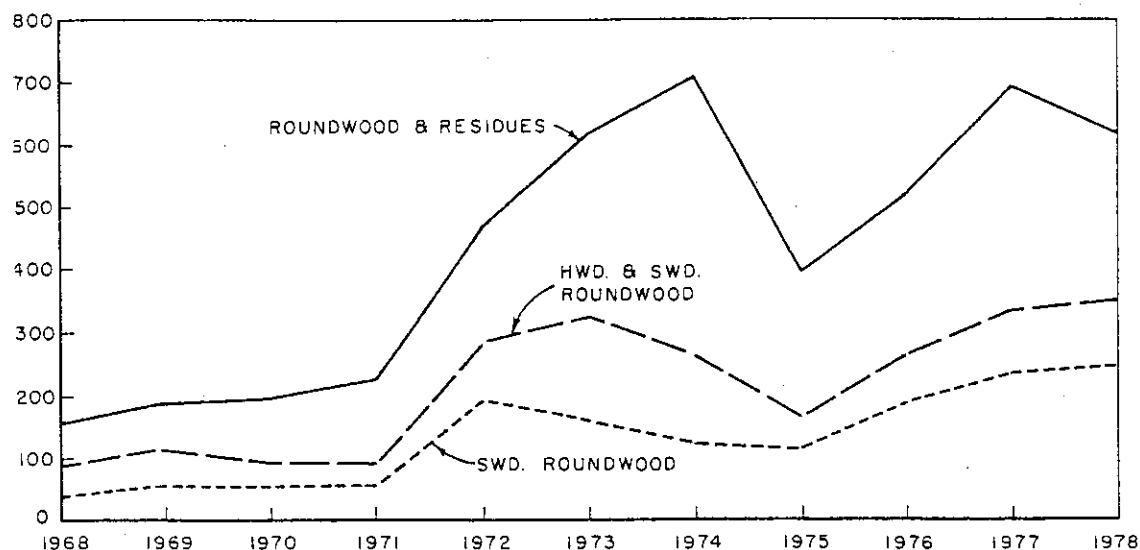

Figure 2.—Pulpwood production in Oklahoma, 1968-1978.

PULPWOOD

Oklahoma's roundwood used for pulp production increased fourfold from 90,000 cords in 1968 to 349,000 cords in 1978. While pulpwood production has varied in the past decade, production has increased annually since 1975 (fig. 2).

Softwoods (pines exclusively) comprised 70 percent of the total pulpwood harvested compared with 45 percent in 1968. Oaks and other hardwoods have continued to be the main components of hardwood pulpwood production.

Expansion of existing facilities increased Oklahoma's pulping capacity from 465 tons per day in 1968 to 2,970 tons in 1978. The sulfate process is currently used for over 50 percent of the pulpwood.

In addition to roundwood volume, the equivalent of 265,000 cords of plant byproducts were used by pulpmills.

OTHER PRODUCTS

Veneer log harvest in Oklahoma totaled 37 million board feet, accounting for 8 percent of the State's roundwood production. Oklahoma has one veneer plant

that manufactures southern pine plywood. Hardwood veneer logs are exported out of State to veneer mills.

Most remaining 1978 timber went into nearly 10 million pine posts and poles—more than twice the 1975 production and 62 percent greater than 1972. Other products were charcoal, hardwood handlestock, and furniture stock.

PLANT RESIDUES

In converting roundwood into primary products, plants generated over 31 million cubic feet of residues. Of this volume, 74 percent was in coarse form suitable for conversion into pulp chips. The rest was finer material such as sawdust and shavings. The coarse chips were used for fiber production and accounted for 72 percent of total utilization. As in 1975, an important use of the finer wood residues was for industrial fuel and constituted 22 percent of primary byproduct consumption.

Over 370,000 tons of bark accumulated in 1978 and nearly 90 percent was used, chiefly for industrial fuel.
