Foreword

This report contains the findings of a 1994 canvass of all primary wood-using plants in North Carolina and presents changes in product output and residue use since 1992. It complements the Forest Inventory and Analysis periodic inventory of volume and removals from the State's timberland. The canvass was conducted to determine the amount and source of wood receipts and annual timber product drain by county in 1994 and to determine interstate and cross-regional movement of industrial roundwood. Only primary wood-using mills were canvassed. Primary mills are those that process roundwood in log or bolt form or as chipped roundwood. Examples of industrial roundwood products are saw logs, pulpwood, veneer logs, poles, and logs used for composite board products. Mills producing products from residues generated at primary and secondary processors were not canvassed. Trees chipped in the woods were included in the estimate of timber drain only if they were delivered to a primary domestic manufacturer.

A 100-percent canvass of all wood processors in North Carolina was conducted in 1995 to obtain information for 1994. Out-of-State mills known to be using logs or bolts harvested from North Carolina timberland were also contacted. Each mill was canvassed by mail or through personal contact at plant locations. Telephone contacts followed mailed ques-

tionnaire responses when additional information or clarification of response was necessary. In the event of a nonresponse, data collected in previous surveys were updated by current data collected for mills of similar size, product type, and location. Surveys for all timber products other than pulpwood began in 1964 and are currently conducted every 2 years.

Pulpwood production data were taken from an annual canvass of all southeastern pulpmills, conducted annually in cooperation with the American Pulpwood Association. Medium density fiberboard, insulating board, and hardboard plants were included in this survey.

The Southern Research Station gratefully acknowledges the cooperation and assistance provided by the North Carolina Department of Environment, Health, and Natural Resources, Division of Forest Resources in collecting mill data. Appreciation is also extended to forest industry and mill managers for providing timber products information. The information in this report is based on responses from 98 percent of mills operating in 1994; 8 pulpmills, 26 of the 27 veneer mills, 4 composite panel mills, 7 of the 8 mills manufacturing other industrial products, and 269 of the 275 sawmills. They accounted for 99 percent of the 1994 mill receipts.

North Carolina's Timber Industry: An Assessment of Timber Product and Output Use, 1994

Output of Industrial Timber Products

In economic importance, timber production and the wood products industry ranks third in North Carolina behind textiles and equipment manufacturing, according to the N.C. Forestry Association. Between 1992 and 1994, the combined output of industrial roundwood timber products and plant byproducts increased 6 percent to 1.14 billion cubic feet. Timber product output (TPO) from roundwood was up 47 million cubic feet to 846 million cubic feet. Output from plant byproducts increased 22 million cubic feet to 297 million cubic feet, and accounted for 26 percent of total output (table 1). Output of softwood roundwood products increased 2 percent to 539 million cubic feet, 64 percent of North Carolina's total output of roundwood timber products (fig. 1). Hardwood roundwood production increased nearly 13 percent to 307 million cubic feet.

Pulpwood and saw logs were the principal roundwood products in 1994. Combined output for these two products amounted to 743 million cubic feet, nearly 88 percent of the State's total roundwood output (fig. 2).

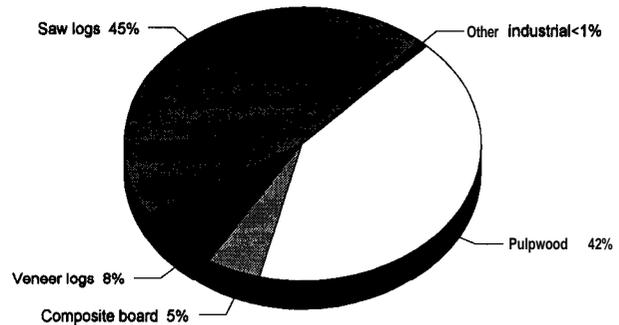

Figure 2—Roundwood production, by type of production, 1994.

Saw Logs

Saw-log production in North Carolina accounted for 45 percent of the State's total roundwood products output in 1994. Since 1992, combined output of softwood and hardwood saw-log production was up 10

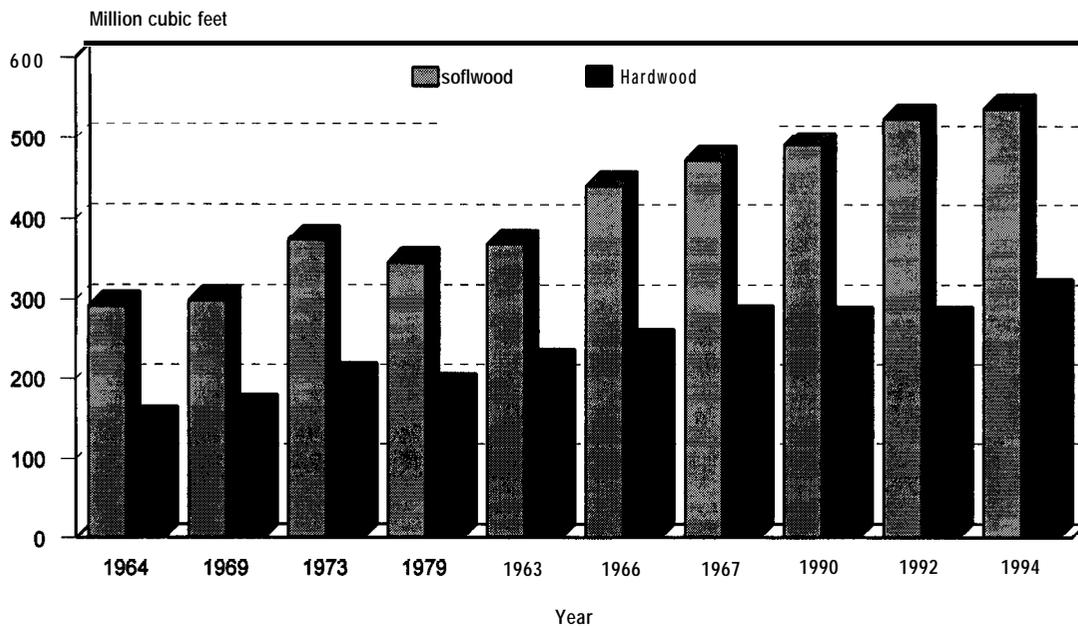

Figure 1— Roundwood production for all production, by species group and year.

percent and totaled 384 million cubic feet, or nearly 2.2 billion board feet. This production is equivalent to the volume of lumber needed to construct about 220,000 single-family homes. Output of softwood saw logs increased 11 percent since 1992 and totaled 275 million cubic feet (1.5 billion board feet). Hardwood saw-log production was up 8 percent to 109 million cubic feet (0.7 billion board feet). Hardwoods accounted for 28 percent of the saw-log production in 1994. This level of production has remained relatively stable since 1984 (fig. 3). Southern yellow pine accounted for 94 percent of the softwood saw logs harvested in the State in 1994, while yellow-poplar made up 27 percent and hard hardwoods (mostly oaks) made up more than half of the hardwood saw-log output (not shown).

Pulpwood

Pulpwood production was close behind saw logs in roundwood production. Output of pulpwood (including chipped roundwood) increased from 349 million cubic feet (4.7 million cords) in 1992 to 359 million cubic feet (4.8 million cords) in 1994 (Johnson 1994). Pulpwood production accounted for 42 percent of the State's total roundwood output. This proportion has remained relatively stable since the early 1970's (Howell 1994). Hardwood output accounted for all of the increase in 1994. Softwood output declined by 8 percent to about 199 million cubic feet, while hardwood output was up 20 percent to 180 million cubic feet. Hardwood's share of total pulpwood production

has continued to increase in North Carolina (fig. 4). In 1984, hardwood accounted for 28 percent of the State's pulpwood production, compared with nearly 45 percent in 1994. Softwoods accounted for 55 percent of North Carolina's pulpwood production in 1994, compared to 82 percent in 1992.

Veneer Logs

Output of veneer logs in 1994 totaled 83 million cubic feet, a 1 -percent increase since 1992. Veneer production accounted for about 8 percent of the State's total roundwood TPO in 1994. Softwoods continued to dominate the veneer industry in North Carolina, with pine plywood the principal product. Output of softwood veneer logs increased 6 percent to 43 million cubic feet (249 million board feet). In 1964, softwood veneer production was practically nonexistent in North Carolina, amounting to less than 1 million cubic feet or about 3 percent of total veneer production. By 1986, however, softwood veneer production had peaked at nearly 60 million cubic feet and accounted for more than three-fourths of the veneer production (fig. 5). In 1994, softwoods accounted for 68 percent of the State's veneer production, about 3 percent more than in 1992. Output of hardwood veneer logs dropped 7 percent to 20 million cubic feet (126 million board feet). Southern yellow pine accounted for most of the softwood roundwood harvested for veneer, while soft hardwoods (mostly yellow-poplar and sweetgum) accounted for 66 percent of the hardwood roundwood harvested for veneer (not shown).

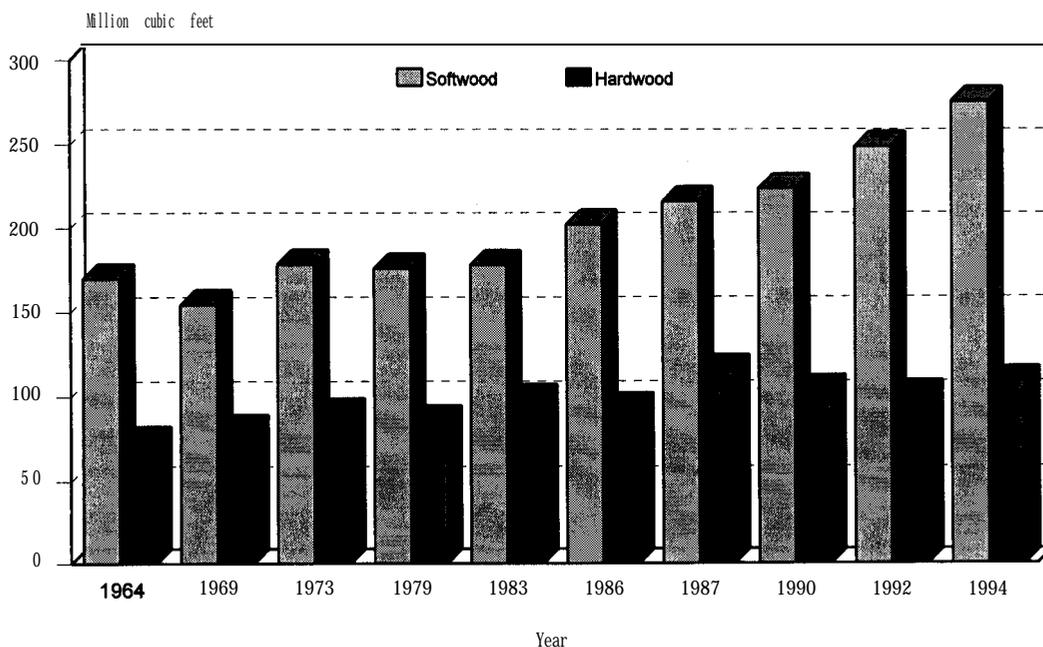

Figure 3-Roundwood saw-log production, by species group and year.

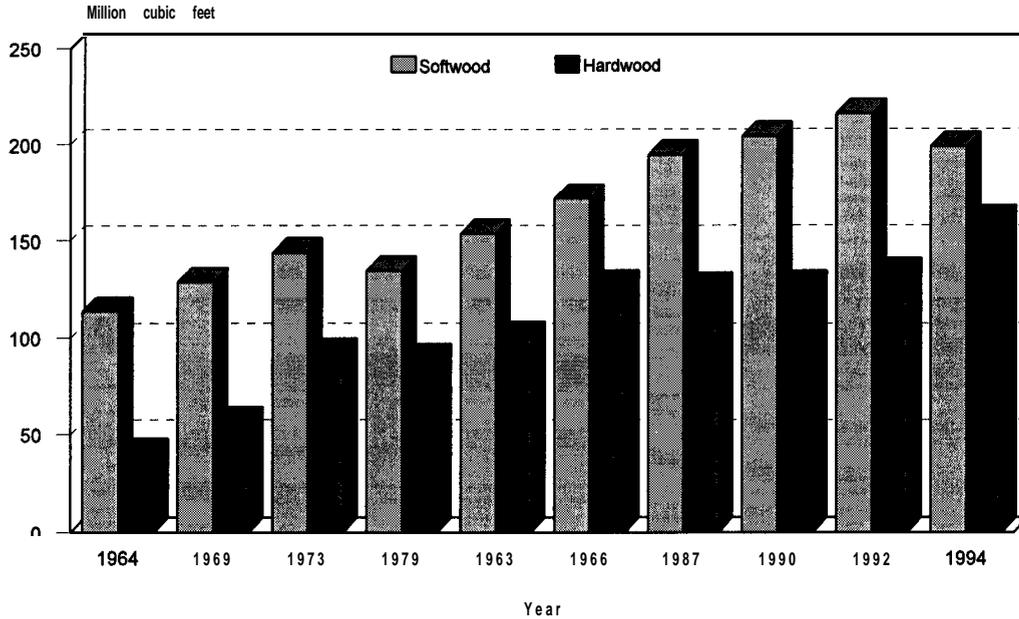

Figure 4—Roundwood pulpwood, by species group and year.

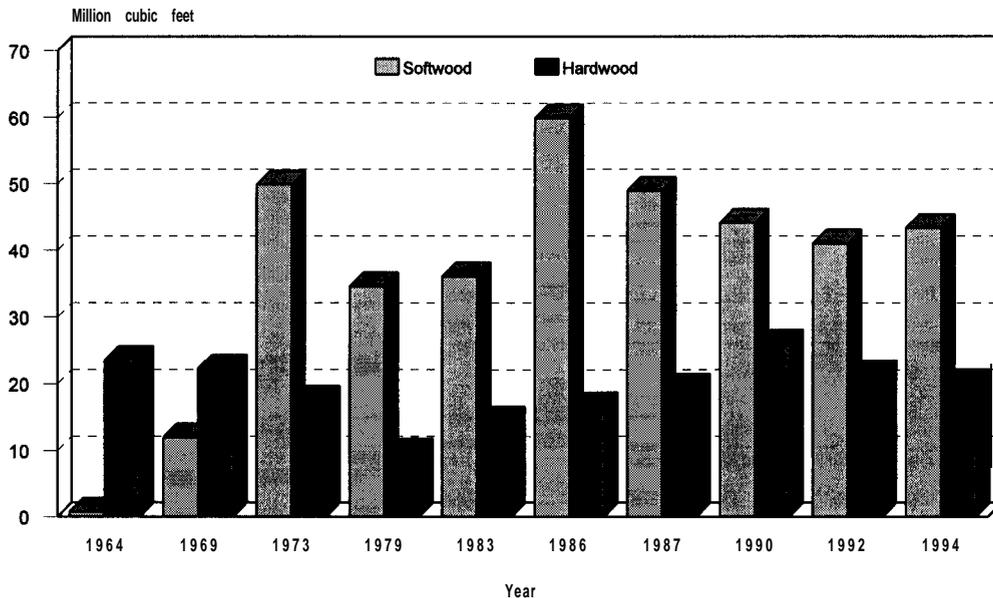

Figure 5—Roundwood veneer-log production, by species group and year.

Composite Panels

Between 1992 and 1994, roundwood harvested from North Carolina's forests for composite panels increased 6 percent and totaled nearly 38 million cubic feet. Almost two-thirds of this volume was used in the production of oriented strand board (OSB) in North Carolina mills. Composite panel production made up 5 percent of the State's total roundwood TPO volume in 1994. Softwood output was up 7 percent to 19 million cubic feet and accounted for more than half of the composite panel production. Hardwood production increased 6 percent to nearly 19 million cubic feet (fig. 6). Yellow pine accounted for all of the softwood

volume used in composite panels, while soft hardwoods accounted for 80 percent of the hardwood volume used in the production of composite panels (not shown).

Other Industrial Products

Roundwood harvested for other industrial uses such as poles, posts, mulch, firewood, and all other industrial products totaled 2.7 million cubic feet in 1994, a 23-percent decline since 1992. Softwood⁸ made up most of the other industrial product volume. Roundwood used for other industrial products accounted for less than 1 percent of North Carolina's total TPO in 1994.

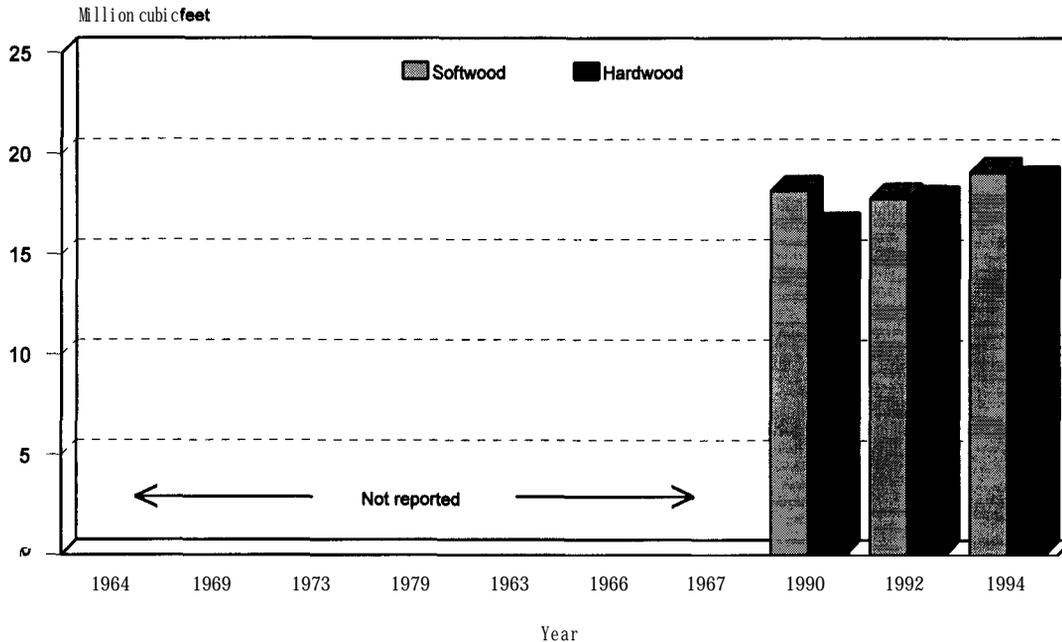

Figure 6—Roundwood production for composite panel, by species group and year.

Number of Mills and Receipts

Total receipts at North Carolina mills, which include roundwood harvested and retained in the State and roundwood imported from other States, was up nearly 5 percent to 773 million cubic feet (table 2). At the same time, the number of primary roundwood-using plants in North Carolina declined from 357 in 1992 to 322 in 1994, a 10-percent decline (table 3). This continues a general downward trend since 1979.

Sawmills. North Carolina had a net loss of 31 sawmills between 1992 and 1994. This substantial decline does not account for many changes in the industry over the past 2 years: the startup of 19 sawmills with combined receipts of almost 82 million board feet and the closing of 50 sawmills with total receipts of 92 million board feet. Over the same period, total saw-log receipts increased 37 million cubic feet to 387 million cubic feet, a 10-percent increase since 1992. In 1994, sawmill receipts accounted for half of the State's total receipts. Softwood saw-log receipts were up 9 percent to 270 million cubic feet, while those of hardwoods increased 14 percent to 117 million cubic feet. Yellow pine accounted for 93 percent of the State's total softwood saw-log receipts. Out of the 275 mills currently operating, 173 mills had receipts of less than 5 million board feet and accounted for 12 percent of total receipts. While only 58 of the mills had receipts greater than 10 million board feet, these mills accounted for 74 percent of total receipts (table 4).

Pulpmills. Eight pulpmills were operating and receiving roundwood in 1994, the same as in 1992. The State's total pulpwood receipts were down by 2 percent to 284 million cubic feet, while the 24-hour pulping capacity for these mills increased from 8,398 tons to 8,465 tons (Johnson and Howell 1996; Miller 1994). Softwood receipts were down 12 percent to 165 million cubic feet, while hardwood receipts increased nearly 19 percent to 119 million cubic feet. Softwoods accounted for 58 percent of the pulpwood receipts. Receipts of round pulpwood in 1994 accounted for 37 percent of total receipts for all mills (table 5).

Veneer Mills. The number of veneer mills operating in North Carolina dropped from 29 to 27 between 1992 and 1994. At the same time, veneer receipts across the State increased 1.3 million cubic feet, or 2 percent, to 69 million cubic feet. Receipts of softwood veneer logs increased 5 percent to 44 million cubic feet, while hardwood veneer receipts declined 3 percent to 25 million cubic feet. Most of the softwood veneer-log receipts were Southern yellow pine used to manufacture plywood, while 68 percent of total hardwood veneer receipts were used in the manufacture of plywood. Soft hardwoods (yellow-poplar, sweetgum, and soft maple) made up the bulk of hardwood veneer receipts. Veneer accounted for 9 percent of North Carolina's total receipts for all products.

Composite Panel Mills. Four composite panel mills were operating in North Carolina in 1994, the same as in 1992. Total receipts for these mills were 31 million cubic feet, or 4 percent of the State's total receipts.

Softwood receipts for composite panels totaled 18 million cubic feet and hardwood receipts totaled 13 million cubic feet. Softwoods accounted for 58 percent of the composite panel receipts.

Other Industrial Mills. The number of plants producing other industrial products has declined from 10 to 8 since 1992. At the same time, receipts at the remaining mills totaled 1.8 million cubic feet, down nearly 0.7 million cubic feet since 1992. Current facilities include two pole mills, four post mills, one shavings mill, and one firewood processor.

Roundwood Movement

Note: To follow the logic of this section, the reader must understand that certain terms—namely, production, retained, export, import, and receipts—have specialized meanings and relationships unique to the Forest Inventory and Analysis Units across the country that deal with timber products output (fig. 7).

North Carolina continues to be a net exporter of industrial roundwood. In 1994, the State retained 878 million cubic feet, or 80 percent of its production (table 6). The same proportion of the production was retained for processing within the State in 1992. Imports from other States totaled 94 million cubic feet, a small decline from 1992. Exports to mills outside North Carolina amounted to 188 million cubic feet, up 7 percent. Exports of all softwood products exceeded imports by nearly 40 million cubic feet, while hardwood exports were nearly double hardwood imported into the State.

The volume of whole trees cut or trees chipped in the woods and delivered to chip facilities for export overseas is not included in the estimate of export volume or roundwood production. Most of this volume is in hardwood chips destined for wood fiber companies in Japan, Korea, and Taiwan. As a result, hardwood volume produced or exported from North Carolina is underestimated.

Roundwood pulpwood accounted for 75 percent of total known exports to other States and 55 percent of total imports from other States (table 7). Round pulpwood exports amounted to 128 million cubic feet, or 74 million cubic feet more than was imported. Saw logs accounted for the next largest share, 30 percent, of the import total and accounted for 15 percent of the export total.

Saw Logs. North Carolina retained 93 percent of its saw-log production for domestic manufacture (table 8),

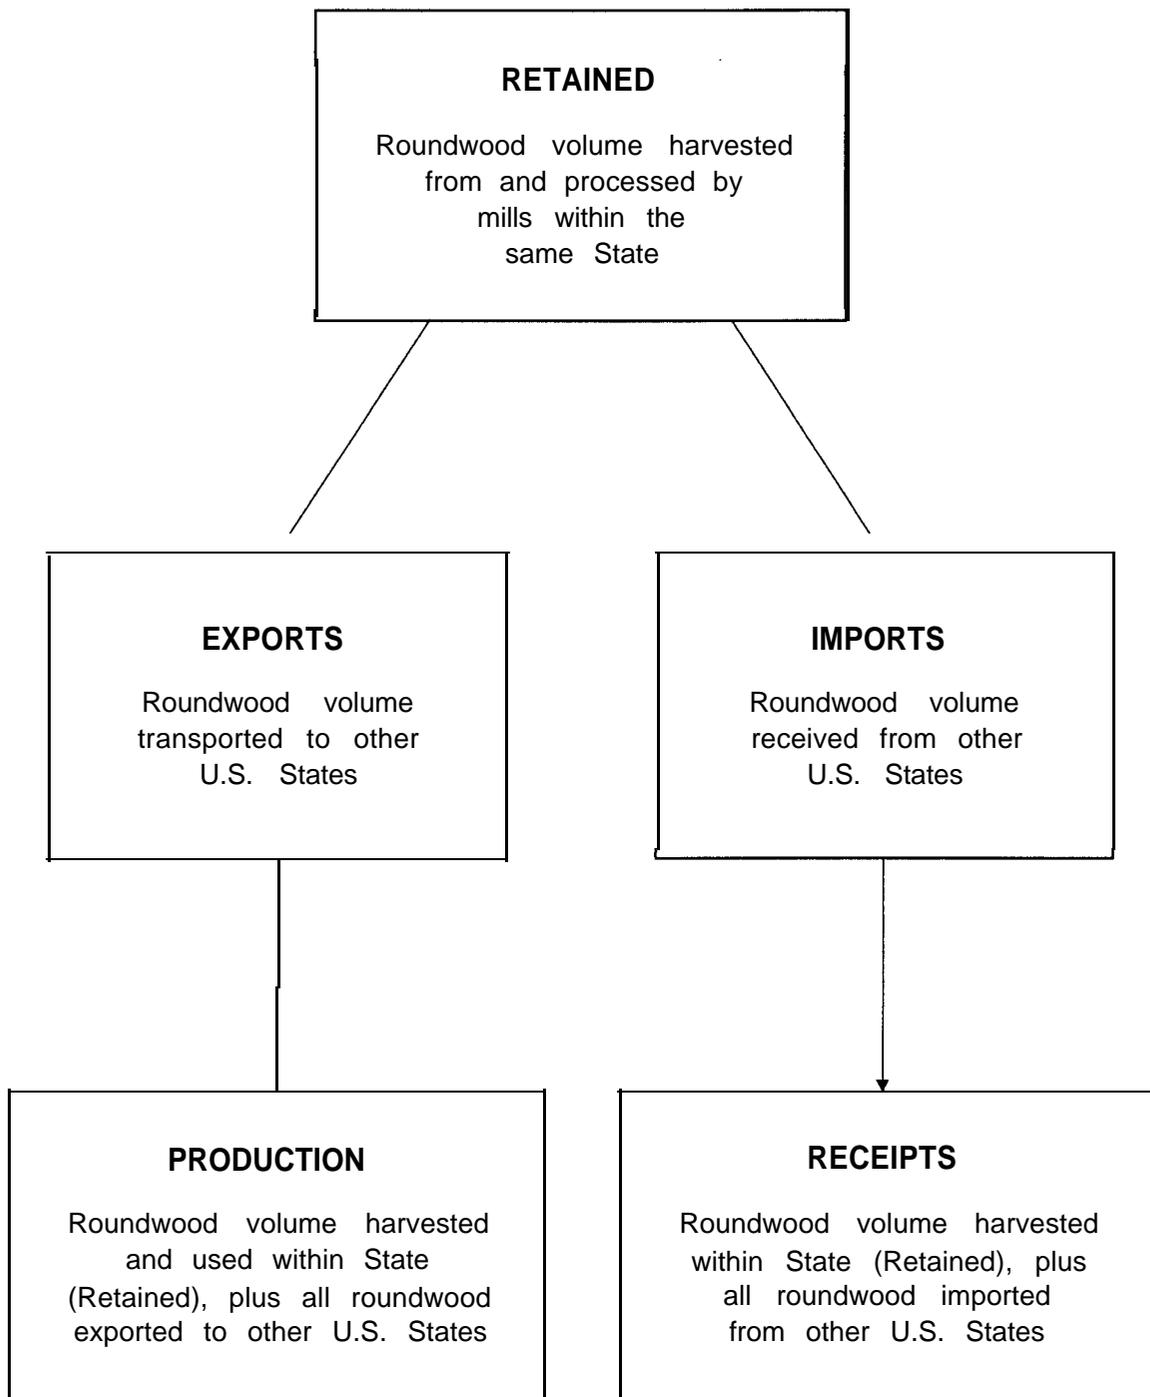

about the same proportion reported in 1992. However, the State remains a net importer of saw logs by a slim margin. About 29 million cubic feet of saw logs were imported, with hardwoods making up more than half of the imports. North Carolina mills received saw logs from Virginia (47 percent), South Carolina (44 percent), Georgia (5 percent), Tennessee (3 percent), and Kentucky, Maryland, Pennsylvania, and West Virginia (1 percent). Saw-log exports of 25 million cubic feet were divided among Virginia (60 percent), South Carolina (40 percent), and a negligible portion to Florida. Softwoods accounted for three-fourths of the saw-log exports.

Veneer Logs. North Carolina retained 93 percent of its veneer-log production for processing at domestic veneer mills (table 9). Imports amounted to nearly 10 million cubic feet, while exports totaled 4 million cubic feet, making the State a net importer of roundwood veneer logs. Sources of the imports were South Carolina (46 percent), Virginia (22 percent), Tennessee and Kentucky (10 percent each), Maryland and West Virginia (3 percent each), and the remainder coming from Georgia, Maine, New York, Ohio, Vermont, and other States (3 percent). Veneer exports went to Virginia (91 percent) and South Carolina (9 percent). Softwoods accounted for 80 percent of the export volume.

Pulpwood. North Carolina retained 65 percent of the roundwood cut for pulpwood for processing at domestic pulpmills (table 10). Exports of 126 million cubic feet exceeded imports more than twofold, making the State a net exporter of pulpwood. Exports went to South Carolina (72 percent), Virginia (21 percent), Tennessee (7 percent), and a negligible portion to Florida, Georgia, and Pennsylvania. Imports of 52 million cubic feet came primarily from South Carolina (54 percent), Virginia (30 percent), Tennessee (8 percent), Georgia (8 percent), and a negligible amount from Kentucky.

Composite Panels. Almost 70 percent of the roundwood production harvested for composite panels was retained for processing in North Carolina composite panel mills (table 11). Exports of 11 million cubic feet were more than two times the amount imported into the State. All of the roundwood exported for composite panel production went to Virginia. Imports amounting to more than 4 million cubic feet came almost entirely from Virginia.

Other Industrial. North Carolina was also a net exporter of roundwood used for other industrial products (table 12). Sixty-three percent of the roundwood harvested for other industrial products was

Production = Retained + Exports

Receipts = Retained + Imports

Figure 7-Movement of roundwood exports and imports within the United States.

retained for processing within the State. All of the 152,000 cubic feet imported was softwood and came from South Carolina. All of the 1 million cubic feet exported out of State was also softwood, which went to South Carolina (75 percent), Virginia (23 percent), and Florida (2 percent).

Plant Byproducts

In 1994, processing of primary products in North Carolina mills generated more than 299 million cubic feet of wood and bark residues (table 13). Coarse residues from all primary products amounted to 125 million cubic feet (42 percent), while bark volume totaled 74 million cubic feet (25 percent). Collectively, sawdust and shavings made up one-third of total residues, or 100 million cubic feet (fig. 8). Of the mill residues generated, 88 percent came from the processing of softwoods and 32 percent from hardwoods. About 99 percent of the residues generated, both softwood and hardwood, became products or industrial fuel (fig. 9). Nearly 103 million cubic feet, or 82 percent of the coarse residues, were used for fiber products, while 11 million cubic feet were used for industrial fuel. The remainder was used for composite panels, sawn products, particleboard, and other miscellaneous products (table 14). Most of the bark was used for industrial fuel or other miscellaneous products. More than 63 percent of the sawdust and shavings was used for industrial fuel; 11 percent was used in the manufacture of particleboard; 24 percent for other miscellaneous products, and less than 1 percent was not used for a product.

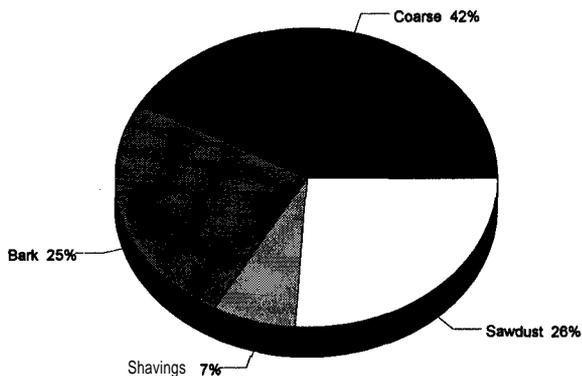

Figure 8-Primary mill residue, by residue type.

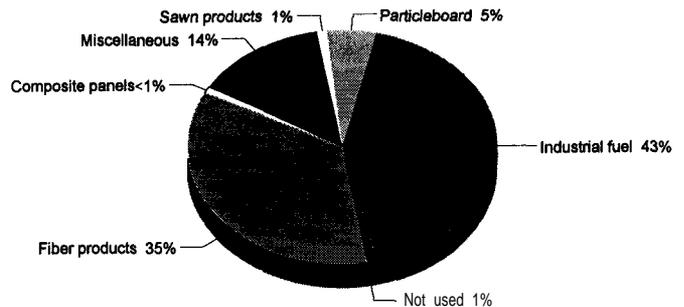

Figure 9—Disposal of residue, by product.

Saw Logs. In 1994, sawmills generated more than 228 million cubic feet of mill residues accounting for 76 percent of the total residues produced (fig. 10). About 92 percent of the 105 million cubic feet of coarse residues from saw logs was used for fiber products, particleboard, and composite panels (not shown). Bark and sawdust generated amounted to 102 million cubic feet and were used mostly for industrial fuel and miscellaneous products. Shavings from dressed lumber totaled 21 million cubic feet. Fifty-five percent of the shavings was used for miscellaneous uses such as mulch or animal bedding.

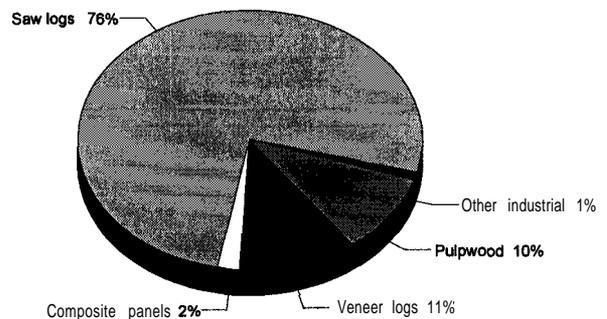

Figure 10-Primary mill residue, by residue type.

Veneer Logs. Veneer mills generated more than 32 million cubic feet of residues in 1994, 11 percent of the State’s total primary mill residue volume. Nearly 21 percent of the 19 million cubic feet of coarse veneer residues was veneer cores, which were sawn into framing studs or landscape timbers. The slabs from these cores, along with other coarse residues, were chipped for use in fiber products. Sawdust and bark, totaling 13 million cubic feet, were used primarily for industrial fuel.

Pulpwood and Composite Panels. Bark was the only residue associated with roundwood pulpwood or composite panel mills. Bark volumes reported from the eight pulpmills and four composite panel mills in North Carolina totaled 36 million cubic feet. Most was used for fuel by the same mills that produced it. Bark from roundwood pulpwood and composite panel production accounted for 49 percent of the total bark volume at all primary mills.

Other Industrial. Residues of all types from other industrial products totaled more than 2 million cubic feet, 1 percent of North Carolina's total mill residue volume. Coarse residues of 400 thousand cubic feet were used mainly for industrial fuel. Sawdust and bark, totaling 2 million cubic feet, were used mostly for industrial fuel and miscellaneous uses.

Regional Trends

Between 1992 and 1994, total output of industrial roundwood products increased in all regions of the State; the Mountain Region of North Carolina had the largest increase, 13 percent. Output for all softwood products increased in all regions except the Northern Coastal Plain, while output of all hardwood products increased substantially in all regions of the State. Changes in output varied considerably by product and by region; however, softwood accounted for 56 percent or more of industrial roundwood products in all regions except the Mountain Region, where hardwood accounted for 61 percent of total output.

Southern Coastal Plain Region

Roundwood output from the 21 counties of the Southern Coastal Plain Region totaled more than 276 million cubic feet in 1994, a 9-percent increase since 1992 (table 15). Both softwood and hardwood output totals increased for the region; softwood output was up 8 percent, and hardwood production was up 9 percent. Hardwood veneer, hardwood used for composite panels, and softwood used for other industrial products were the only products to show a decline in production in this region. Output of hardwood veneer dropped 5 percent to 8 million cubic feet, while hardwood used for composite panels dropped 28 percent to 2 million cubic feet. Seventy-three percent of the total roundwood TPO was softwood; the largest proportion of any region in North Carolina.

Pulpwood is still the leading product in the Southern Coastal Plain Region. Pulpwood production of 129 million cubic feet accounted for 47 percent of the

region's total TPO and for 36 percent of the State's total roundwood pulpwood output. The 103 million cubic feet of saw logs accounted for 37 percent of the region's total roundwood output; this figure represents 27 percent of the State's total saw-log output. Total veneer production was up nearly 4 million cubic feet, and accounted for more than half of the veneer logs harvested in North Carolina during 1994. Seventy-four percent of the State's other industrial products came from this region as well. Of the 21 counties in this area, 2 produced more than 20 million cubic feet; 12 produced between 10 and 20 million cubic feet; 4 produced between 5 and 10 million cubic feet; and 3 produced less than 5 million cubic feet (table 16). In the Southern Coastal Plain Region, 43 primary wood-using plants were operating during 1994, 6 less than in 1992-2 pulpmills, 31 sawmills, 7 veneer or plywood mills, 1 OSB mill, and 2 pole mills (fig. 11). These mills processed 33 percent of the State's total roundwood output.

Northern Coastal Plain Region

Roundwood output from the 23 counties of the Northern Coastal Plain Region totaled 262 million cubic feet in 1994, a 1-percent increase since 1992 (table 17). A 3-percent decline in softwood output was totally offset by an 11-percent increase in hardwood production. Softwood pulpwood, softwood used for other industrial products, and hardwood sawlogs declined in production in this region. Output of softwood pulpwood dropped 28 percent to 60 million cubic feet, and hardwood saw-log production dropped 4 percent to 20 million cubic feet. More than two-thirds of the total roundwood TPO was softwood.

Saw logs were the leading product in the Northern Coastal Plain Region, which produces more saw-log volume than any other region of the State. Saw-log production of 118 million cubic feet accounted for 45 percent of the region's total TPO and for 31 percent of the State's total saw-log output. Pulpwood production for both softwoods and hardwoods was down nearly 12 percent to 14 million cubic feet. This figure represents 44 percent of the region's total roundwood output and 32 percent of the State's total pulpwood output. Thirty-three percent of the veneer logs harvested in North Carolina during 1994 came from the Northern Coastal Plain Region; however, only 7 percent of the State's other industrial products came from this region. Of the 23 counties in this area, 2 produced more than 20 million cubic feet; 9 produced between 10 and 20 million cubic feet; 7 produced between 5 and 10 million cubic feet; and 5 produced less than 5 million cubic feet (table 18). In the Northern Coastal

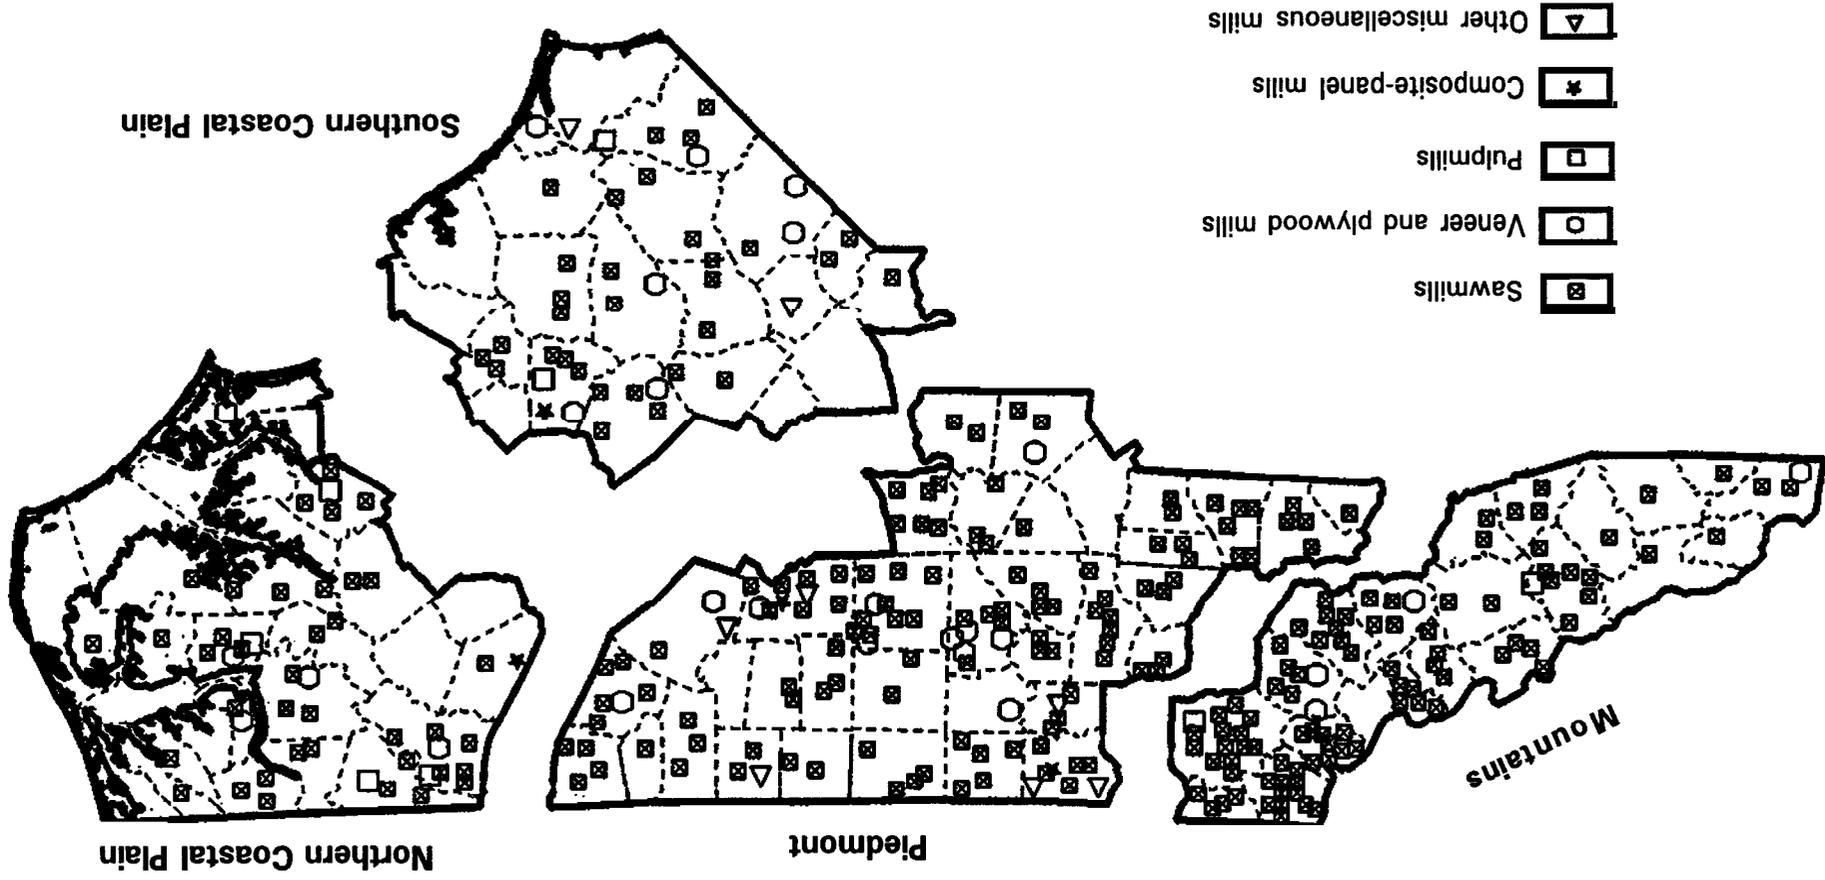

Figure 11—Primary wood-using mills by regions.

Plain Region, 49 primary wood-using plants were operating during 1994, 4 less than in 1992-4 pulp-mills, 39 sawmills, 5 veneer or plywood mills, 1 composite panel mill. These mills processed 31 percent of the State's total roundwood output.

Piedmont Region

In 1994, nearly 221 million cubic feet of roundwood were produced in the 35 counties making up the Piedmont Region of North Carolina. This total reflects an increase of nearly 6 percent between 1992 and 1994 (table 19). The region ranks a close third in the production of roundwood products in the State, with 26 percent of the total output. Softwood production remained relatively stable at 127 million cubic feet and accounted for 58 percent of the total roundwood output. Hardwood output for all products increased 14 percent, with the largest increases in pulpwood, sawlog, and composite panel production.

Saw-log production of 120 million cubic feet accounted for 54 percent of the total roundwood production for this area. The Piedmont Region was the only region where saw-log production far exceeded pulpwood production. Production of pulpwood was up by 19 percent and accounted for 34 percent of the region's total roundwood output. This region produced 31 percent of the State's saw logs, 7 percent of the veneer logs, 21 percent of the pulpwood, 53 percent of the composite panel production, and 18 percent of the roundwood used for other industrial products. Six counties in the 35-county area produced more than 10 million cubic feet; 13 counties produced between 5 and 10 million cubic feet; and 16 counties produced less than 5 million cubic feet (table 20). In the Piedmont Region, 134 primary wood-using plants were operating in 1994, 7 less than in 1992—1 15 sawmills, 11 veneer or plywood plants, 2 composite panel mills, 4 post mills, and 2 other miscellaneous mills.

Mountain Region

In 1994, roundwood output from the 21 counties of the Mountain Region increased 13 percent to 87 million cubic feet (table 21). The region produced 10 percent of the State's total roundwood TPO. Softwood production was up 5 percent to 34 million cubic feet and accounted for 39 percent of the total roundwood output. Total hardwood output increased 19 percent to 53 million cubic feet, with increases recorded for all products except hardwood veneer.

Saw-log production increased 14 percent to 43 million cubic feet and accounted for 49 percent of the total roundwood production for this area. Production of

pulpwood increased 14 percent to 40 million cubic feet and accounted for 46 percent of the region's total roundwood output. This region produced 11 percent of the State's saw logs, 11 percent of the pulpwood, 4 percent of the veneer logs, 4 percent of the composite panel production, and 1 percent of the other industrial production. One county in the PI-county area produced more than 10 million cubic feet; 6 counties produced between 5 and 10 million cubic feet; and 14 counties produced less than 5 million cubic feet (table 22). In the Mountain Region, 96 primary wood-using plants were operating in 1994, 18 less than in 1992-90 sawmills, 4 veneer or plywood plants, and 2 pulpmills.

Definitions

Board feet. Unit of measure applied to roundwood. It relates to lumber that is 1 foot long, 1 foot wide, and 1 inch thick (or its equivalent).

Composite panels. Consists of structural panels (oriented strand board or waferboard), particleboard (industrial underlayment, thin panelboard).

Consumption. The quantity of a commodity, such as pulpwood, utilized.

Drain. The volume of roundwood removed from any geographic area where timber is grown.

Exports. The volume of roundwood utilized by mills outside the State where timber was cut.

Industrial roundwood products. Any primary use of the main stem of a tree, such as saw logs, poles, pilings, veneer logs, pulpwood, posts, or cooperage logs.

Industrial fuelwood. A roundwood product, with or without bark, used to generate energy at a manufacturing facility such as a wood-using mill.

Imports. The volume of roundwood delivered to a mill or group of mills in a specific State but harvested from outside that particular area.

Plant residues. Wood material generated in the production of timber products at primary manufacturing plants.

Coarse residues. Suitable for chipping such as slabs, edgings, trim, veneer cores, and ends.

Fine residues. Not suitable for chipping such as sawdust, shavings, and veneer clippings.

Log. A primary forest product harvested in long, primarily 8-foot lengths.

Primary wood-using plants. Industries that receive roundwood or chips from roundwood for the manufacture of products such as veneer, pulp, and lumber.

Production. The total volume of roundwood harvested from land within the specified State, regardless of where consumed. Production is the sum of timber harvested and used within the State, plus all roundwood exported to other U.S. States.

Pulpwood. A roundwood product that will be reduced to individual wood fibers by chemical or mechanical means. The fibers are used to make a broad generic group of pulp products that includes paper products as well as chipboard, fiberboard, insulating board, and paperboard.

Receipts. The quantity or volume of industrial roundwood received at a mill or by a group of mills in a State, regardless of the geographic source. Volume of roundwood receipts is equal to the volume of roundwood retained in a State plus roundwood imported from other U.S. States.

Retained. Roundwood volume harvested from and processed by mills within the same State.

Roundwood. Logs, bolts, or other round sections cut from trees for industrial manufacture or consumer use.

Roundwood chipped. Any timber cut primarily for industrial manufacture, delivered to non-pulpmills, chipped, and then sold to pulpmills for use as fiber. Includes tops, jump sections, and whole trees.

Roundwood product drain. That portion of total drain used for a product.

Saw log. A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight, and with minimum diameter inside bark of 6 inches for softwoods and 8 inches for hardwoods.

Standard cord. A unit measure applied to roundwood, usually bolts or split wood. It relates to a stack of wood 4 feet high, 4 feet wide, and 8 feet long-encompassing 128 cubic feet of wood, bark, and air space. In Florida this usually translates to 74.8 cubic feet of solid wood for pulpwood, since pulpwood is more uniform.

Timber products output. Roundwood production in an area's forests (equals roundwood product drain).

Timber removals. The merchantable volume of trees removed from the timberland inventory by harvesting, cultural operations such as stand improvement, land clearing, or changes in land use.

Veneer log. Logs to be used in the production of plywood, finished panels, or veneer sheets, both rotary cut and sliced.

Conversion Factors^a

Saw Logs

Softwood 0.18018 cubic foot = 1 board foot
 5.55 board feet = 1 cubic foot

Hardwood 0.18556 cubic foot = 1 board foot
 6.04 board feet = 1 cubic foot

Veneer Logs

Softwood 0.17391 cubic foot = 1 board foot
 5.75 board feet = 1 cubic foot

Hardwood 0.15873 cubic foot = 1 board foot
 6.30 board feet = 1 cubic foot

Pulpwood^b

Softwood 72.50 cubic feet/cord

Hardwood 76.60 cubic feet/cord

^a Conversion factors vary with stem size (d.b.h.) and species.
The factors shown are for trees of average diameters removed in North Carolina during the latest survey period.

^b Cubic feet of solid wood per cord.

Table 1 -Output of industrial products, by product, and species group, North Carolina, 1992 and 1994

^a Includes roundwood that was delivered to non-pulpmills and then chipped end sold to pulpmills (544,000 cubic feet in 1994).

The Forest Service, U.S. Department of Agriculture, is dedicated to the principle of multiple use management of the Nation's forest resources for sustained yields of wood, water, forage, wildlife, and recreation. Through forestry research, cooperation with the States and private forest owners, and management of the National Forests and National Grasslands, it strives-as directed by Congress-to provide increasingly greater service to a growing Nation.

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, and marital or familial status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means of communication of program information (braille, large print, audiotape, etc.) should contact the USDA office of Communications at **(202) 720-2791**. To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, DC 20250, or call **(202) 720-7327** (voice) or **(202) 720-1127 (TDD)**. USDA is an equal employment opportunity employer.

Johnson, Tony G.; Brown, David R. 1996. North Carolina's timber industry: an assessment of timber product and output use, 1994. Resour. Bull. SRS-4. Asheville, NC: U.S. Department of Agriculture, Forest Service, Southern Research Station. 31 p.

In 1994, volume of roundwood products removed from North Carolina's forests totaled 848 million cubic feet-8 percent more than in 1992. Mill byproducts generated from primary manufacturers increased 8 percent to 297 million cubic feet. Almost all of the plant residues were used, mostly for fuel and fiber products. Saw logs and pulpwood were the leading roundwood products at 384 and 359 million cubic feet, respectively; veneer logs were third with 83 million cubic feet. The number of primary processing plants declined from 357 in 1992 to 322 in 1994. Total receipts increased 5 percent to 773 million cubic feet.

KEYWORDS: Roundwood, residues, pulpwood, saw logs, veneer logs, wood movement.

Southern Research Station

Established 1921

The Southern Research Station, headquartered in Asheville, North Carolina, is one of the seven regional Stations and the Forest Products Laboratory that make up the Forest Service research organization.

RESEARCH MISSION:

To acquire the knowledge, develop the technology, and disseminate the research findings required to manage the Southern forest resources in ways that satisfy demands of goods and services while maintaining a quality environment.
