Mississippi Forest Industry

Dwane D. Van Hooser

U. S. DEPARTMENT OF AGRICULTURE
FOREST SERVICE

SOUTHERN FOREST EXPERIMENT STATION
New Orleans, Louisiana

1968

Foreword

This report is the result of a 100-percent field canvass of the primary forest industries in Mississippi. Similar surveys were made in 1956 and 1962.

To obtain the 1966 information, every known installation in the State was contacted, along with those firms in other States which were known to process roundwood from Mississippi. While reasonable effort was made to locate all active plants, some may have been omitted. Omission of a firm is no reflection upon its activities, nor does inclusion constitute a recommendation.

Mississippi Forest Industry

Nearly 402 million cubic feet of industrial roundwood were harvested in Mississippi in 1966. This was the largest harvest in a decade. Nearly three-fifths was softwood—mainly pine. Altogether, 305 million cubic feet were processed by the State's forest industries. Some 123 million cubic feet were shipped to surrounding States, while 26 million cubic feet were brought into Mississippi.

Pulpwood and saw logs combined accounted for more than 90 percent of the harvest; 200 million cubic feet of pulpwood and 167 million cubic feet of sawtimber were removed.

PULPWOOD

The pulp industry processed 2.5 million cords of round pulpwood from Mississippi forests in 1966 and utilized 474,200 cord-equivalents of residues from other wood-using industries in the State. Total production is not only a record high, but represents a 30-percent increase over 1965.

With the exception of a few periods of slight decline, the trend of pulpwood production in Mississippi has been upward since 1946 (fig. 1). This trend is very likely to continue upward and could rise sharply in the near future. There are now seven pulpmills operating in the State, and new mills are under construction near Monticello and Vicksburg. These mills will boost the State's pulping capacity from 3,605 to 6,140 tons per day—an increase of 70 percent. They are likely to stimulate an increase in total pulpwood production of more than a million cords per year.

The 474,200 cord-equivalents of residue consumed by pulpmills in 1966 represent a sixfold increase since 1956 and are nearly twice the

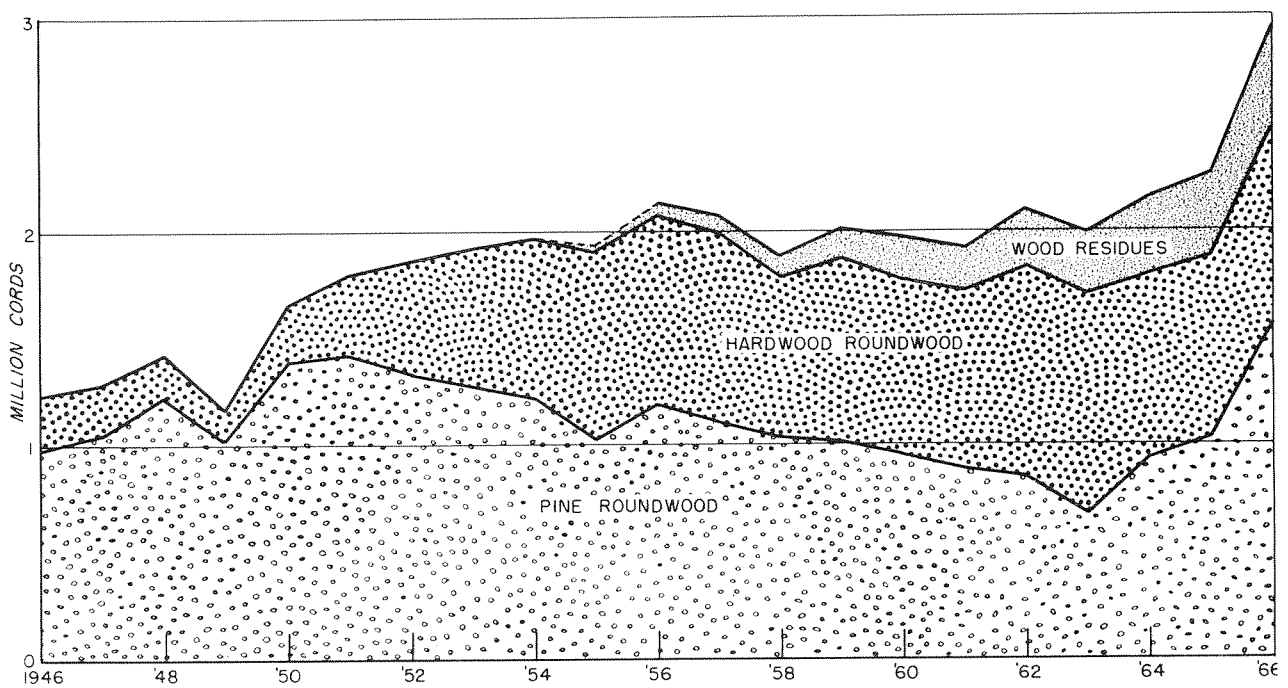

Figure 1.—*Pulpwood production trends in Mississippi, 1946 to 1966.*

amount consumed in 1962. The increasing number of chipping installations at wood-using plants other than pulpmills indicates that residues will continue to be an important source of supply in Mississippi. In 1956, 13 sawmills were chipping their slabs and edgings; 67 sawmills had chippers in 1962, and at least 85 had them in 1966. In addition, 18 of the State's veneer mills are now chipping plant residues.

In 1966, Mississippi's wood-using industries produced nearly 92 million cubic feet of residue; 59 percent of it was coarse, i.e., slabs, edgings, veneer cores, and the like. Nearly 65 million cubic feet of residue were used, primarily by the pulp and paper industry. The volume of unused residue is gradually decreasing as more and more wood-using mills install chippers to convert their coarse residues to a form acceptable to pulpmills. In addition, the pulp industry has begun using sawdust in the manufacture of some products.

Tree-length chipping installations are another important innovation that will probably influence the pulpwood supply pattern in the near future.

Of the 2.5 million standard cords of round pulpwood produced in 1966, nearly 60 percent were shipped to plants outside the State for processing. Eighty-five percent of the exported material was pine. Incoming shipments from surrounding States totaled 38,900 cords, all of which were hardwood. This is an abrupt change from 1962 when the State exported 502,000 cords while importing nearly 192,000 cords. Since then, exports have increased by 183 percent and imports have decreased by 80 percent.

SAW LOGS

Saw logs accounted for 42 percent of the roundwood produced by Mississippi forest industries in 1966. A total of 350 sawmills cut more than a billion board feet of saw logs, slightly more than half of which were pine.

Both number of sawmills and lumber production increased between 1962 and 1966, reversing a trend that had been evident since the late forties. These increases indicate that the industry may be stabilizing. In 1962, 88 large sawmills (those cutting more than 3 million board feet per year) and 202 small sawmil (those cutting less than 3 million board fe per year) were operating in Mississippi. The are now 108 large sawmills and 242 small on in the State. Sixteen of the large mills we classed as small in 1962.

Since 1962 lumber production has increase by 26 percent. Large sawmills processed abo 83 percent of the logs sawn in the State in 196 More than 10 million board feet were cut each of 22 mills.

More than 52 percent of the saw-log harve was softwood, which was almost all pine b included some cypress and redcedar. Oak and sweetgum made up nearly two-thirds c the hardwood cut.

Of the 1,009 million board feet of saw log harvested, 96 percent were processed withi the State. The balance, 43 million board fee was shipped to Alabama, Arkansas, Louisian and Tennessee. Mississippi imported 96 millio board feet from these States for processing b resident mills.

VENEER

All veneer manufactured in Mississippi i rotary-cut. Nearly one-third of it goes int containers; the rest is largely commercial ve neer which is used in such products as plywoo and furniture facing. Commercial veneers re quire logs of larger minimum diameter an higher quality than do container veneers.

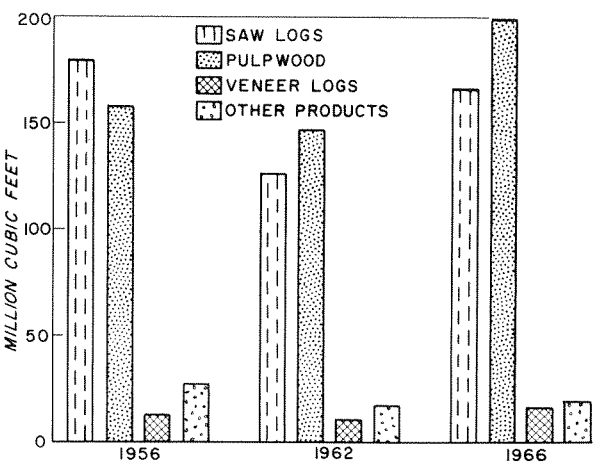

Figure 2.—*Roundwood harvest in Mississippi, b product and industrial survey year.*

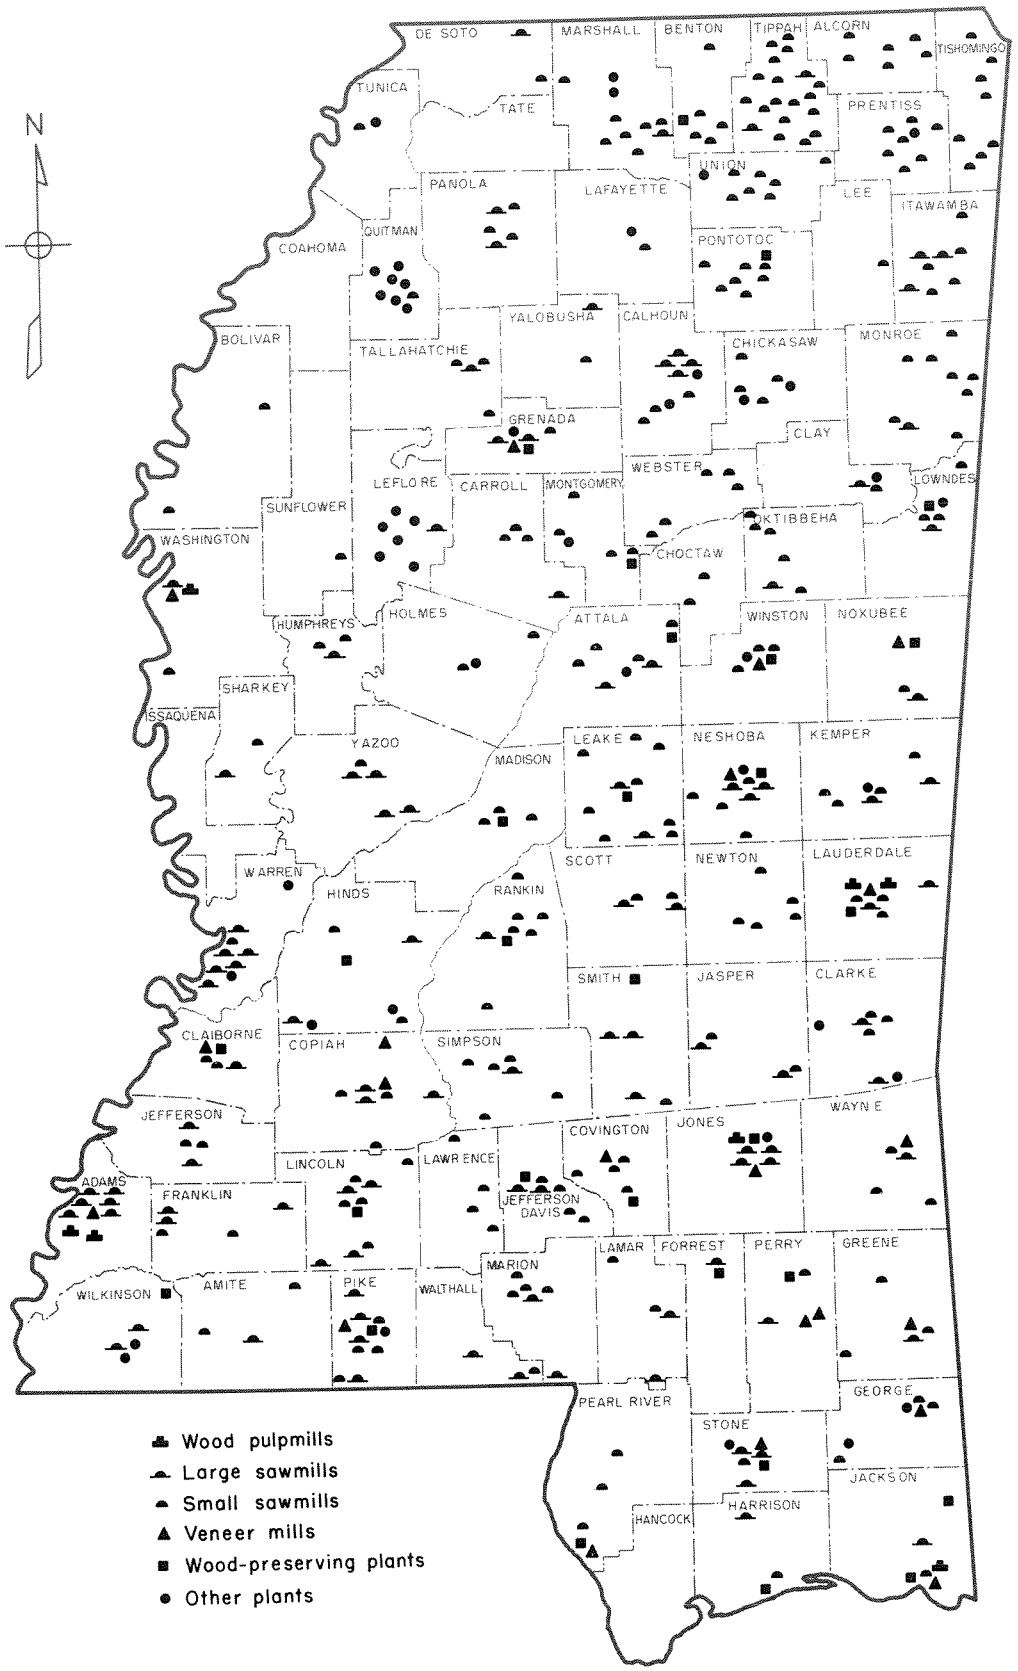

Figure 3.—*Location of primary wood-using plants in Mississippi, 1966.*

Mississippi's 22 veneer plants obtain about 80 percent of their raw material from within the State. Output of veneer logs in 1966 totaled 98 million board feet, of which 2.5 million were exported. About 25 million board feet were imported. Most of the imports were from Alabama, Arkansas, and Louisiana, but some came from as far away as South America. Mississippi veneer mills consumed 120 million board feet of logs, an average of 5.5 million per plant.

Nearly half of the veneer logs cut in Mississippi in 1966 were pine. In 1956, not one Mississippi pine log was used by the veneer industry, and in 1962 only 437,000 board feet were used. In 1966, however, the industry consumed nearly 45 million board feet of pine. The increase is due primarily to the growth of the southern pine plywood industry.

OTHER PRODUCTS

Mississippi has long been a top-ranking pro ducer of poles and piling. In 1966, nearl 800,000 pines were cut from Mississippi forest for poles, and some 4.9 million linear feet c piling were harvested. Only 11,500 poles wer exported to surrounding States. The wooc preserving industry within Mississippi import ed nearly 75,000 poles and slightly more tha 2 million linear feet of piling. Most of the pole and all of the piling went to pressure-treatin plants. A large majority of the commercia posts also went to such plants. There are 1 pressure-treating plants and 11 nonpressur plants in the State.

Products such as cooperage, handle stock and miscellaneous dimension made up only percent of the product output.
